

Flynn's Taxonomy
Proposed by Michael Flynn in 1966
SISD – single instruction, single data

Traditional uniprocessor

SIMD – single instruction, multiple data
Execute the same instruction on many data elements
Vector machines, graphics engines
MIMD – multiple instruction, multiple data
Each processor executes its own instructions
Multicores are all built this way
SPMD – single program, multiple data (extension proposed by Frederica Darema)

MIMD machine, each node is executing the same code

MISD – multiple instruction, single data

Systolic array

Infiniband Network

Standardized technology
Multiple vendors
Equipment works together
Competition
Not trying to be the "Internet"

Focus on low latency interconnect needs
Minimize protocol processing
E.g., easier routing, simpler security model
Fast forwarding
Cut-through packet delivery
Remote Direct Memory Access (RDMA)
Supports single-ended messaging

GPU

• Many processing elements (PE), many threads per PE

Collections of threads execute in lock-step (SIMD-like)

· Hide latency to memory by switching threads
