

#### What is SONET?

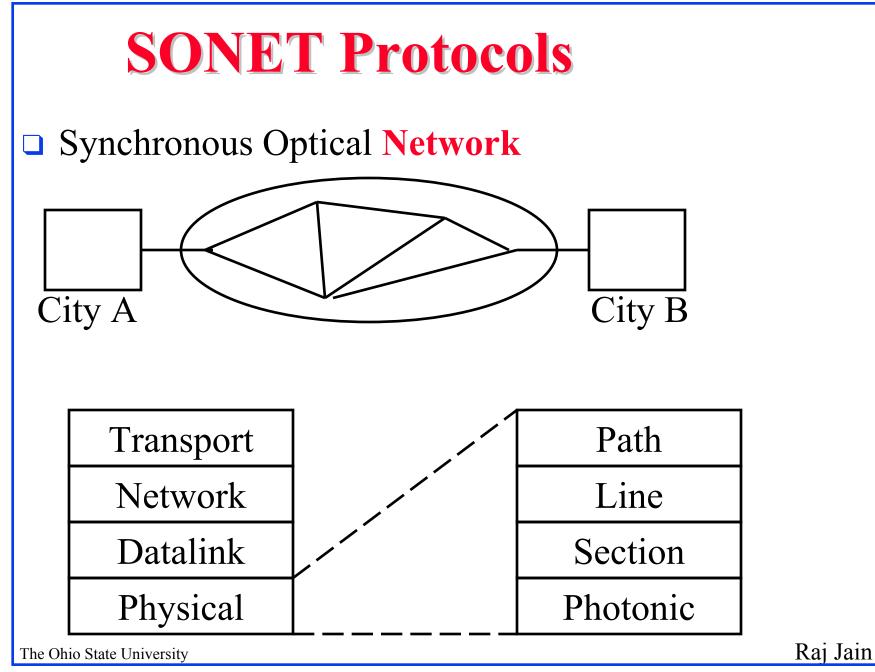

- Synchronous optical network
- Standard for digital optical transmission (bit pipe)
- Developed originally by Bellcore.
   Standardized by ANSI T1X1
   Standardized by CCITT

⇒ Synchronous Digital Hierarchy (SDH)

□ You can lease a SONET connection from carriers

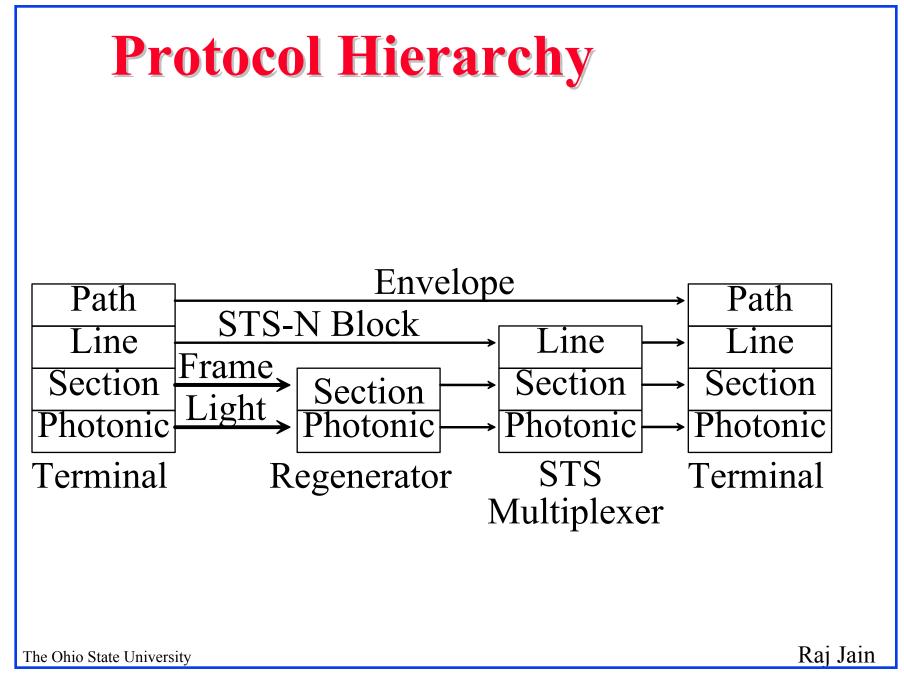

### **Protocols (Cont)**

- Photonic Layer: Characteristics of fibers, transmitters, receivers and encoding (ANSI T1.106-1988)
- Section Layer: Transmission across a single link.
   Framing, scrambling, and error monitoring.
- Line Layer: Signaling between multiplexer switches.
   Frame synchronization. Multiplexing of data in to SONET frames.
- Path Layer: End-to-end signaling issues. Mapping DS3, FDDI, BISDN into SONET payload.

# **Signal Hierarchy**

Synchronous Transport Signal Level  $n = STS-n = n \times 51.84$  Mbps STM=Synchronous Transport Module, OC=Optical Carrier level

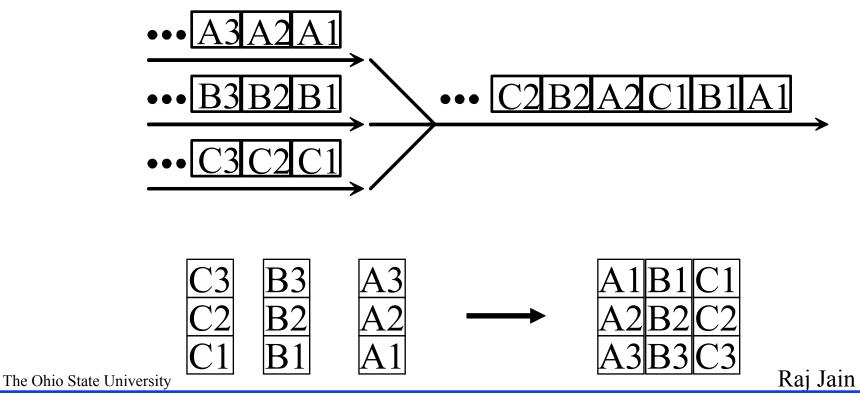

ANSI	Optical	CCITT	Data Rate	Payload Rate
Designation	Signal	Designation	(Mbps)	(Mbps)
STS-1	OC-1		51.84	50.112
STS-3	OC-3	STM-1	155.52	150.336
STS-9	OC-9	STM-3	466.56	451.008
STS-12	OC-12	STM-4	622.08	601.344
<b>STS-18</b>	OC-18	STM-6	933.12	902.016
STS-24	OC-24	STM-8	1244.16	1202.688
STS-36	OC-36	STM-12	1866.24	1804.032
STS-48	OC-48	STM-16	2488.32	2405.376
STS-96	OC-96	STM-32	4976.64	4810.176
STS-192	OC-192	STM-64	9953.28	9620.928

## **Byte Multiplexing**

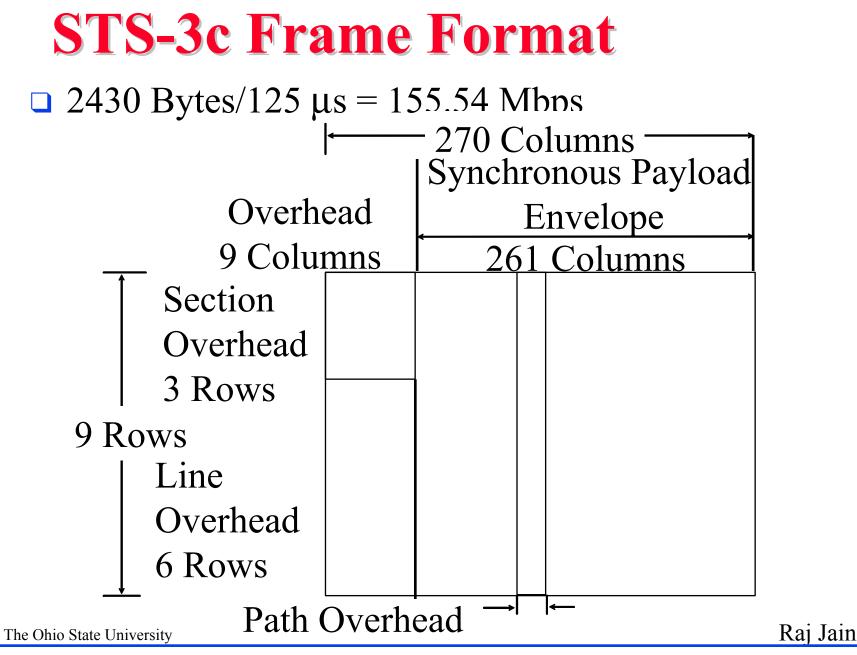

- □ Also known as byte interleaving
- **Easier** to view in two dimension

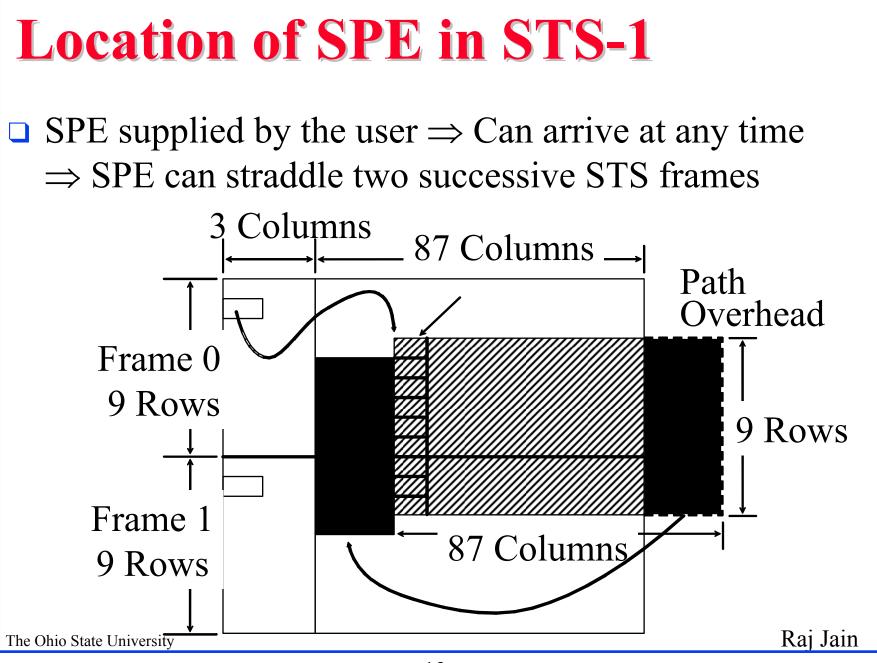

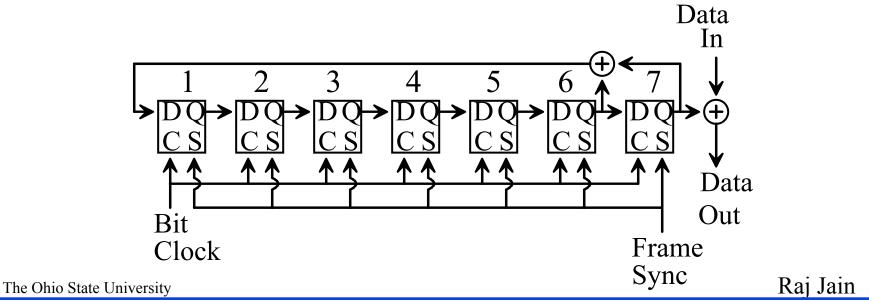

# **Scrambling: Introduction**

Two Methods:

1. Add random sequence

2. Divide by a number and send quotient. Similar to CRC. Both implemented by shift-registers.

Analyzed using polynomials.  $1+x^6+x^7$ 

# **Scrambling (Cont)**

- Set-Reset Synchronous scrambler: Add a fixed random bit pattern. Need to tell where to start adding ⇒ Need to synchronize.
- Self-synchronous scrambler: Divide by a fixed number. No need for synchronization. Errors multiply.
  - Example: Send 12 using divider  $3 \Rightarrow$  Send 4.
  - 1-bit error  $\Rightarrow$  Received  $5 \Rightarrow 15 \Rightarrow 2$ -bit error in data.

## Scrambling

- SONET uses NRZ coding.
   1 = Light On, 0 = Light Off.
- □ Too many 1's or 0's  $\Rightarrow$  Loss of bit clocking information
- □ All bytes (except some overhead bytes) are scrambled
- □ Polynomial  $1 + x^6 + x^7$  with a seed of 11111111 is used to generate a pseudo-random sequence, which is XOR'ed to incoming bits.

1111 1110-0000 0100-0001 ... 010

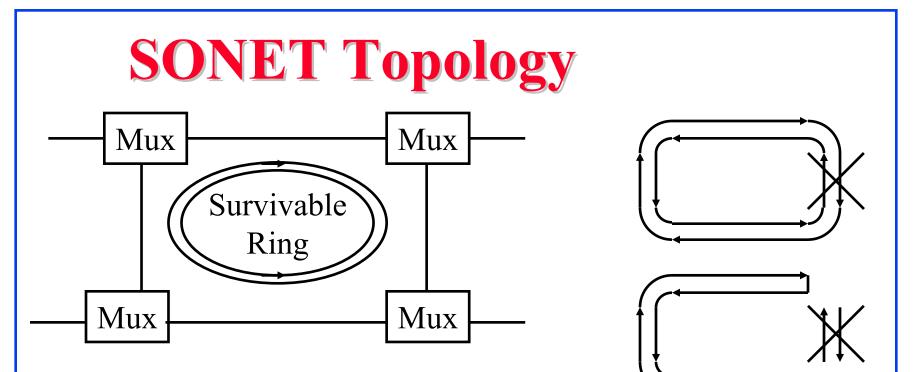

If user data is identical to (or complement of) the pseudo-random sequence, the result will be all 0's or 1's.

The Ohio State University

### **Automatic Protection Switching**

- 100 ms or more is "loss of signal"
   2.3 ms or less is not "loss of signal"
   In-between is up to implementations
- ❑ Most implementations use 13-27 ms
   ⇒ Higher speed lines ⇒ maintain sync for more bits
- □ APS allows switching circuits on fault
- □ May take up to 50 ms to complete
- □ Wastes entire links as standby.
- Protection by routers works faster than by SONET

The Ohio State University

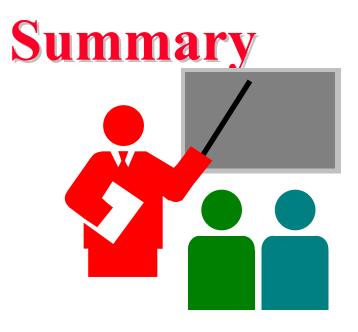

- Two fibers: Working + Protection
  On a fault, faulty cable is isolated and ring heals itself.
- □ Four Fibers: Two working + Two protection
  - $\Rightarrow$  Bi-directional operation  $\Rightarrow$  Traffic sent over shortest path

#### **SONET vs SDH**

#### ANSI vs ITU-T

- Bits 5,6 of SPE/VC pointer are different [RFC2171]
- Synchronous payload envelope (SPE) vs
   Virtual Container (VC)
- □ Network element vs Network node interface
- □ Section vs regenerator section
- Link vs multiplex section

- **SONET**
- **SDH**
- □ STS-n, STM-n
- □ STS-3c
