# The Network Layer: Control Plane

#### Raj Jain

Washington University in Saint Louis Saint Louis, MO 63130 Jain@wustl.edu

Audio/Video recordings of this lecture are available on-line at:

http://www.cse.wustl.edu/~jain/cse473-19/

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

- 1. Routing Algorithms: Link-State, Distance Vector Dijkstra's algorithm, Bellman-Ford Algorithm
- 2. Routing Protocols: OSPF, BGP
- 3. SDN Control Plane
- 4. ICMP
- 5. SNMP

**Note**: This class lecture is based on Chapter 5 of the textbook (Kurose and Ross) and the figures provided by the authors.

#### **Network Layer Functions**

- □ Forwarding: Deciding what to do with a packet using a routing table ⇒ Data plane
- $\square$  Routing: Making the routing table  $\Rightarrow$  Control Plane

#### **Routing Algorithms**

- 1. Graph abstraction
- 2. Distance Vector vs. Link State
- 3. Dijkstra's Algorithm
- 4. Bellman-Ford Algorithm

# **Rooting or Routing**

- □ *Rooting* is what fans do at football games, what pigs do for truffles under oak trees in the Vaucluse, and what nursery workers intent on propagation do to cuttings from plants.
- Routing is how one creates a beveled edge on a table top or sends a corps of infantrymen into full scale, disorganized retreat

Ref: Piscitello and Chapin, "Open Systems Networking: TCP/IP and OSI," Adison-Wesley, 1993, p413

## **Routeing or Routing**

- □ Routeing: British
- □ Routing: American
- □ Since Oxford English Dictionary is much heavier than any other dictionary of American English, British English generally prevails in the documents produced by ISO and CCITT; wherefore, most of the international standards for routing standards use the routeing spelling.

Ref: Piscitello and Chapin, "Open Systems Networking: TCP/IP and OSI," Adison-Wesley, 1993, p413

## **Graph abstraction**

- $\Box$  Graph: G = (N,E)

- Each link has a cost, e.g., c(w,z) = 5
- Cost of path  $(x_1, x_2,..., x_p) = c(x_1,x_2) + c(x_2,x_3) + ... + c(x_{p-1},x_p)$
- □ Routing Algorithms find the least cost path
- We limit to "Undirected" graphs, i.e., cost is same in both directions

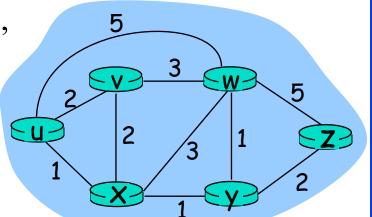

#### Distance Vector vs. Link State

#### **Distance Vector:**

- □ Vector of distances to all nodes, e.g.,u: {u:0, v:2, w:5, x:1, y:2, z:4}
- Sent to neighbors, e.g., u will send to v, w, x
- Large vectors to small # of nodes Tell about the world to neighbors
- Older method. Used in RIP.

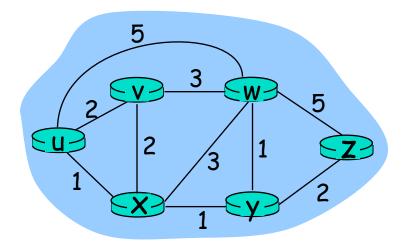

- □ Vector of link cost to neighbors, e.g, u: {v:2, w:5, x:1}
- □ Sent to all nodes, e.g., u will send to v, w, x, y, z
- Small vectors to large # of nodes
  Tell about the neighbors to the world
- Newer method. Used in OSPF.

## Dijkstra's Algorithm

- □ Goal: Find the least cost paths from a given node to all other nodes in the network
- Notation:
  - c(i,j) = Link cost from i to j if i and j are connected
  - D(k) = Total path cost from s to k
  - N' = Set of nodes so far for which the least cost path is known
- Method:
  - > Initialize: N'= $\{u\}$ , D(v) = c(u,v) for all neighbors of u
  - > Repeat until N includes all nodes:
    - $\square$  Find node  $w \notin N'$ , whose D(w) is minimum
    - □ Add w to N'

# Dijkstra's Algorithm: Example

	N'	D(v)	Path	D(w)	Path	D(x)	Path	D(y)	Path	D(z)	Path
0	{u}	2	u-v	5	u-w	1	u-x	8	ı	8	-
1	{u, x}	2	u-v	4	u-x-w			2	u-x-y	8	-
2	$\{u, x, y\}$	2	u-v	3	u-x-y-w					4	u-x-y-z
3	$\{u, x, y, v\}$			3	u-x-y-w					4	u-x-y-z
4	$\{u, x, y, v, w\}$									4	u-x-y-z
5	$\{u, x, y, v, w, z\}$										

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

#### **Complexity and Oscillations**

- □ *Algorithm complexity:* n nodes
  - > Each iteration: need to check all nodes, w, not in N
  - > n(n+1)/2 comparisons:  $O(n^2)$
  - > More efficient implementations possible: O(n log n)
- □ Oscillations Possible: e.g., support link cost equals amount of carried traffic

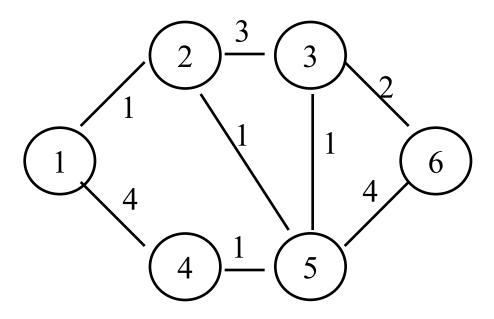

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

#### Homework 5A

[12 points] Prepare the routing calculation <u>table</u> for node 1 in the following network using Dijkstra's algorithm. Explain how you computed new entries in each row.

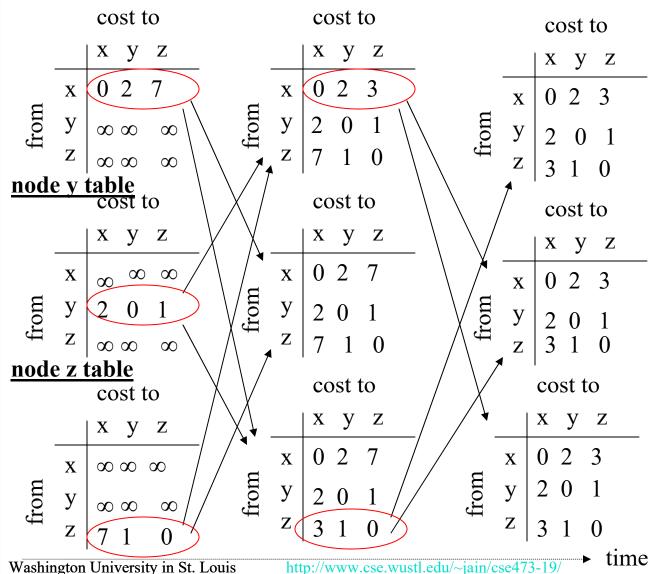

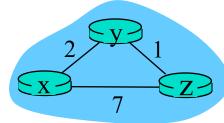

#### **Bellman-Ford Algorithm**

- Notation:
  - u = Source nodec(i,j) = link cost from i to j
  - h = Number of hops being considered
  - $D_u(n) = Cost of h-hop path from u to n$
- Method:
  - 1. Initialize:  $D_u(n) = \infty$  for all  $n \neq u$ ;  $D_u(u) = 0$
  - 2. For each node:  $D_u(n) = \min_j [D_u(j) + c(j,n)]$
  - 3. If any costs change, repeat step 2

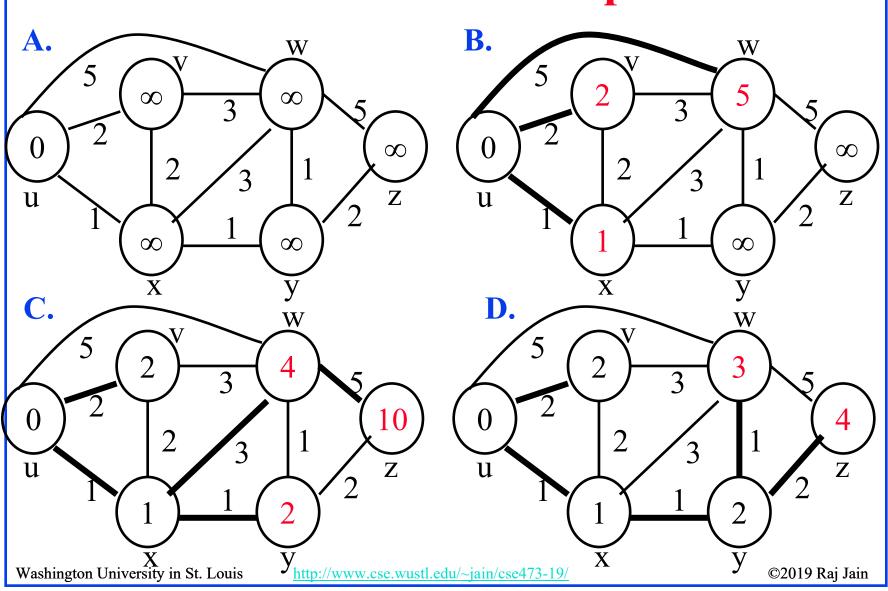

#### node x table

## **Bellman Ford Example 1**

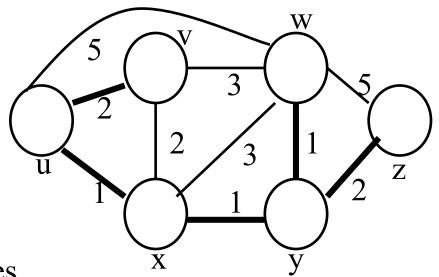

# **Bellman-Ford Example 2**

#### Bellman-Ford: Tabular Method

If cost changes

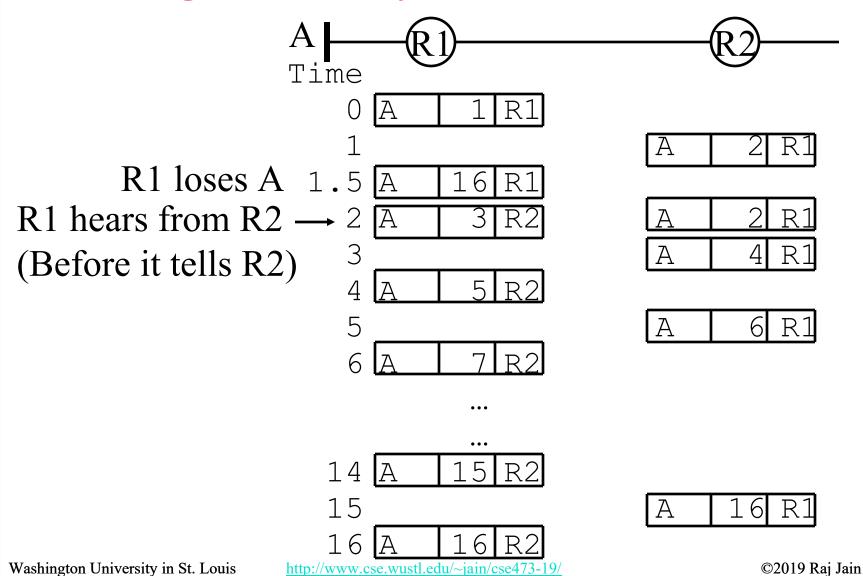

⇒ Recompute the costs to all neighbors

h	D(v)	Path	D(w)	Path	D(x)	Path	D(y)	Path	D(z)	Path
0	8	-	8	-	8	-	8	-	$\infty$	-
1	2	u-v	5	u-w	1	u-x	8	-	$\infty$	-
2	2	u-v	4	u-x-w	1	u-x	2	u-x-y	10	u-w-z
3	2	u-v	3	u-x-y-w	1	u-x	2	u-x-y	4	u-x-y-z
4	2	u-v	3	u-x-y-w	1	u-x	2	u-x-y	4	u-x-y-z

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

## **Counting to Infinity Problem**

5-17

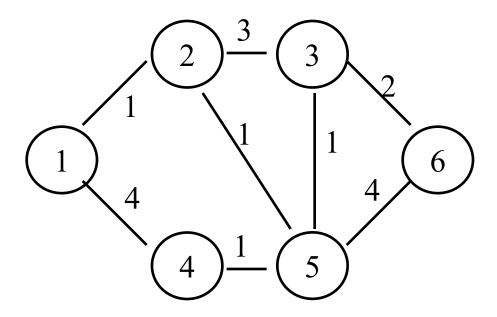

#### Routing Algorithms: Summary

- 1. Distance Vectors: Distance to all nodes in the network sent to neighbors. Small # of large messages.
- 2. Link State: Cost of link to neighbors sent to entire network. Large # of small messages.
- 3. Dijkstra's algorithm is used to compute shortest path using link state
- 4. Bellman Ford's algorithm is used to compute shortest paths using distance vectors
- 5. Distance Vector algorithms suffer from the count-to-infinity problem

Ref: Read Section 5.2 of the textbook and try review questions R3-R6. Washington University in St. Louis <a href="http://www.cse.wustl.edu/~jain/cse473-19/">http://www.cse.wustl.edu/~jain/cse473-19/</a>

#### **Homework 5B**

[10 points] Prepare the routing calculation <u>table</u> for node 1 in the following network using the Bellman-Ford Algorithm. Explain how you computed new entries in each row.

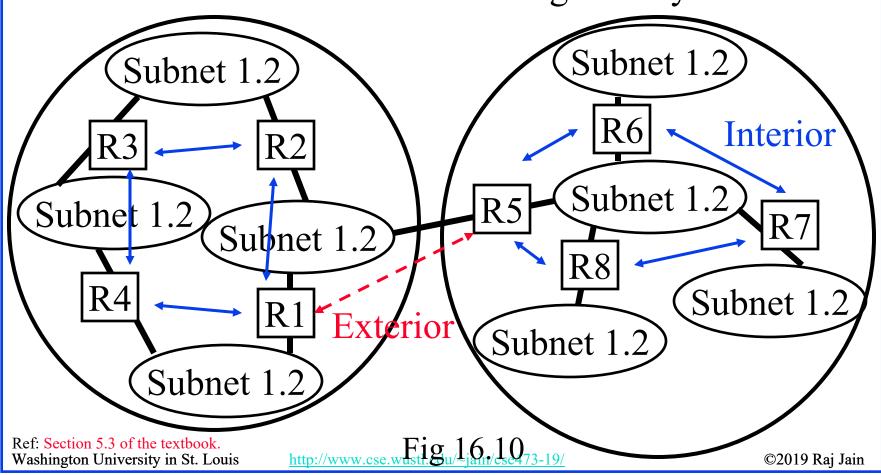

#### **Routing Protocols**

- 1. Autonomous Systems (AS)
- 2. Open Shortest Path First (OSPF)
  - OSPF Areas
- 3. Border Gateway Protocol (BGP)

#### **Autonomous Systems**

■ An internet connected by homogeneous routers under the administrative control of a single entity

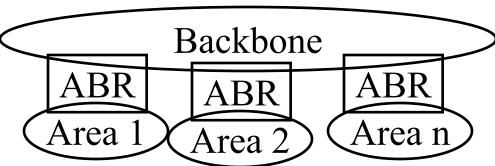

#### **Routing Protocols**

- □ Interior Router Protocol (IRP): Used for passing routing information among routers internal to an autonomous system. Also known as IGP.
  - > Examples: RIP, OSPF, IGRP
- Exterior Router Protocol (ERP): Used for passing routing information among routers between autonomous systems. Also known as EGP.
  - > Examples: EGP, BGP, IDRP
    Note: EGP is a class as well as an instance in that class.

## **Open Shortest Path First (OSPF)**

- □ Uses true metrics (not just hop count)
- Uses subnet masks
- □ Allows load balancing across equal-cost paths
- □ Supports type of service (ToS)
- □ Allows external routes (routes learnt from other autonomous systems)
- □ Authenticates route exchanges
- Quick convergence
- □ Direct support for multicast
- □ Link state routing ⇒ Each router broadcasts its connectivity with neighbors to entire network

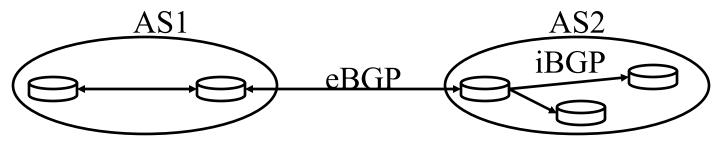

#### **OSPF** Areas

- □ Large networks are divided into areas to reduce routing traffic.
- □ LSAs are flooded throughout the area
- Area border routers (ABRs) summarize the topology and transmit it to the backbone area
- Backbone routers forward it to other areas
- □ ABRs connect an area with the backbone area. ABRs contain OSPF data for two areas. ABRs run OSPF algorithms for the two areas.
- ☐ If there is only one area in the AS, there is no backbone area and there are no ABRs.

#### **Border Gateway Protocol**

- □ Inter-autonomous system protocol [RFC 1267]
- Used since 1989 but not extensively until recently
- □ Runs on TCP (segmentation, reliable transmission)
- Advertises all transit ASs on the path to a destination address
- □ A router may receive multiple paths to a destination ⇒ Can choose the best path
- □ iBGP used to forward paths inside the AS. eBGP used to exchange paths between ASs.

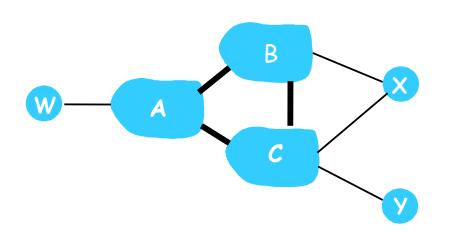

Ref: Section 5.4 of the textbook. Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

## **BGP Operations**

- □ BGP systems initially exchange entire routing tables. Afterwards, only updates are exchanged.
- □ BGP messages have the following information:
  - > Origin of path information: RIP, OSPF, ...
  - > AS\_Path: List of ASs on the path to reach the dest
  - > Next\_Hop: IP address of the border router to be used as the next hop to reach the dest
  - > Unreachable: If a previously advertised route has become unreachable
- □ BGP speakers generate update messages to all peers when it selects a new route or some route becomes unreachable.

## **BGP** Routing Policy Example

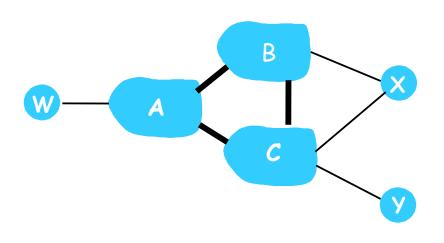

legend: provider network

customer network:

- A,B,C are provider networks
- X,W,Y are customer (of provider networks)
- X is dual-homed: attached to two networks
  - > X does not want to route from B via X to C
  - > .. so X will not advertise to B a route to C

#### **BGP Routing Policy Example (Cont)**

legend:

customer network:

- □ A advertises path A-W to B
- B advertises path B-A-W to X
- □ Should B advertise path B-A-W to C?
  - > No way! B gets no "revenue" for routing C-B-A-W since neither W nor C are B's customers
  - > B wants to force C to route to w via A
  - > B wants to route *only* to/from its customers!

## Intra-vs. Inter-AS Routing

#### **□** Policy:

- > Inter-AS: admin wants control over how its traffic routed, who routes through its net.
- Intra-AS: single admin, so no policy decisions needed

#### □ Scale:

Hierarchical routing saves table size, reduced update traffic

#### **□** Performance:

- > Intra-AS: can focus on performance
- > Inter-AS: policy may dominate over performance

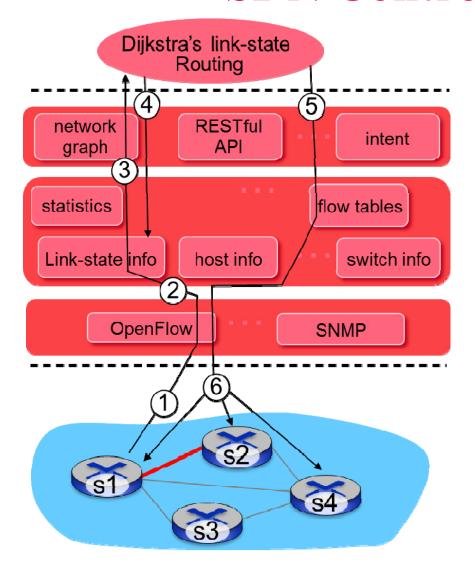

## Routing Protocols: Summary

- OSPF uses link-state routing and divides the autonomous systems into multiple areas.
   Area border router, AS boundary router, designated router
- 2. BGP is an inter-AS protocol  $\Rightarrow$  Policy driven

Ref: Read Section 5.3 and 5.4 of the textbook and try review questions R7-R13. Washington University in St. Louis <a href="http://www.cse.wustl.edu/~jain/cse473-19/">http://www.cse.wustl.edu/~jain/cse473-19/</a>

#### **SDN Control Plane**

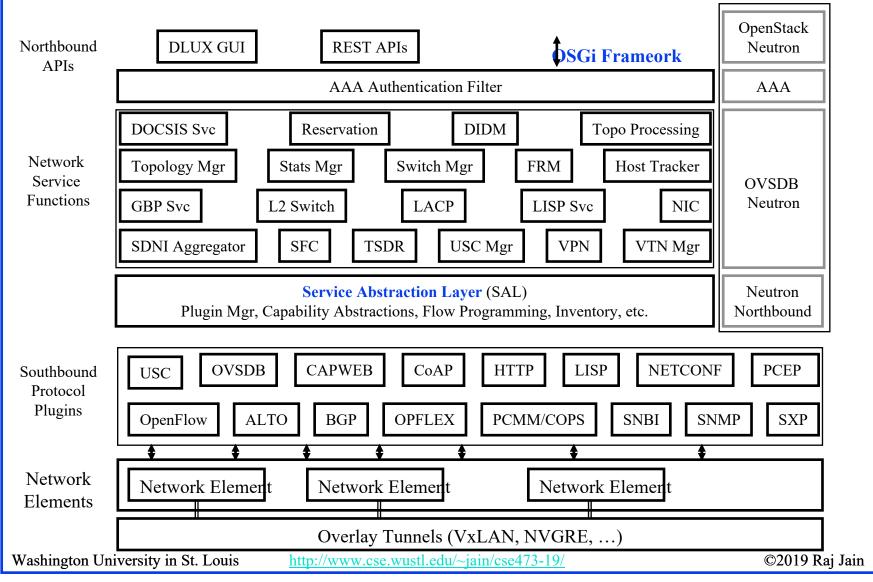

- 1 S1, experiencing link failure using OpenFlow port status message to notify controller
- 2 SDN controller receives OpenFlow message, updates link status info
- 3 Dijkstra's routing algorithm application has previously registered to be called when ever link status changes. It is called.
- 4 Dijkstra's routing algorithm access network graph info, link state info in controller, computes new routes

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

## Controller Example: OpenDaylight

# **OpenDaylight SDN Controller**

- Multi-company collaboration under Linux foundation
- Many projects including OpenDaylight Controller
- □ Dynamically linked in to a Service Abstraction Layer (SAL) ⇒ SAL figures out how to fulfill the service requested by higher layers irrespective of the southbound protocol
- Modular design
- □ A rich set of North-bound APIs via RESTful (Web page like) services

#### **ICMP**

- ☐ Internet Control Message Protocol
- □ Required companion to IP. Provides feedback from the network.
- □ ICMP: Used by IP to send error and control messages
- □ ICMP uses IP to send its messages (Not UDP)
- □ ICMP does not report errors on ICMP messages.
- □ ICMP reports error only on the first fragment

ICMP Header ICMP Data

IP Header Datalink Data

8	Echo request	
11	Time exceeded	
12	Parameter unintelligible	
13	Time-stamp request	
14	Time-stamp reply	
15	Information request	
16	Information reply	
17	Address mask request	
18	Address mask reply	

#### **ICMP Messages**

- Source Quench: Please slow down!I just dropped one of your datagrams.
- □ Time Exceeded: Time to live field in one of your packets became zero." or "Reassembly timer expired at the destination.
- □ Fragmentation Required: Datagram was longer than MTU and "No Fragment bit" was set.
- Address Mask Request/Reply: What is the subnet mask on this net? Replied by "Address mask agent"
- □ PING uses ICMP echo
- □ Tracert uses TTL expired

#### **Trace Route Example**

Trace complete.

#### Lab 5A: ICMP

- [14 points] Download the Wireshark traces from <a href="http://gaia.cs.umass.edu/wireshark-labs/wireshark-traces.zip">http://gaia.cs.umass.edu/wireshark-labs/wireshark-traces.zip</a>
- Open icmp-ethereal-trace-1 in Wireshark. Select View  $\rightarrow$  Expand All. Answer the following questions:
- 1. Examine Frame 3.
  - A. What is the IP address of your host? What is the IP address of the destination host?
  - B. Why is it that an ICMP packet does not have source and destination port numbers?
  - c. What are the ICMP type and code numbers? What other fields does this ICMP packet have? How many bytes are the checksum, sequence number and identifier fields?

- 2. Examine Frame 4. What are the ICMP type and code numbers?
- Open *icmp-ethereal-trace-2* in Wireshark. Answer the following questions:
- 3. Examine Frame 2. What fields are included in this ICMP error packet?
- 4. Examine Frames 100, 101, and 102. How are these packets different from the ICMP error packet 2? Why are they not error packets?

## **Network Management**

- □ What is Network Management?
- Components of Network Management
- □ How is Network Managed?
- □ SNMP protocol

## What is Network Management?

- □ Traffic on Network = Data + Control + Management
- □ Data = Bytes/Messages sent by users
- □ Control = Bytes/messages added by the system to properly transfer the data (e.g., routing messages)
- Management = Optional messages to ensure that the network functions properly and to handle the issues arising from malfunction of any component
- □ If all components function properly, control is still required but management is optional.
- Examples:
  - > Detecting failures of an interface card at a host or a router
  - > Monitoring traffic to aid in resource deployment
  - > Intrusion Detection

#### **Components of Network Management**

#### 1. Fault Management:

Detect, log, and respond to fault conditions

#### 2. **Configuration Management**:

Track and control which devices are on or off

#### 3. Accounting Management:

Monitor resource usage for records and billing

#### 4. Performance Management:

Measure, report, analyze, and control traffic, messages

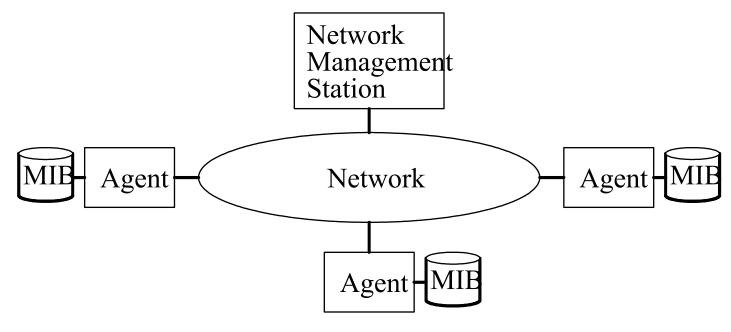

#### 5. Security Management:

Enforce policy for access control, authentication, and authorization

#### **□** FCAPS

## How is Network Managed?

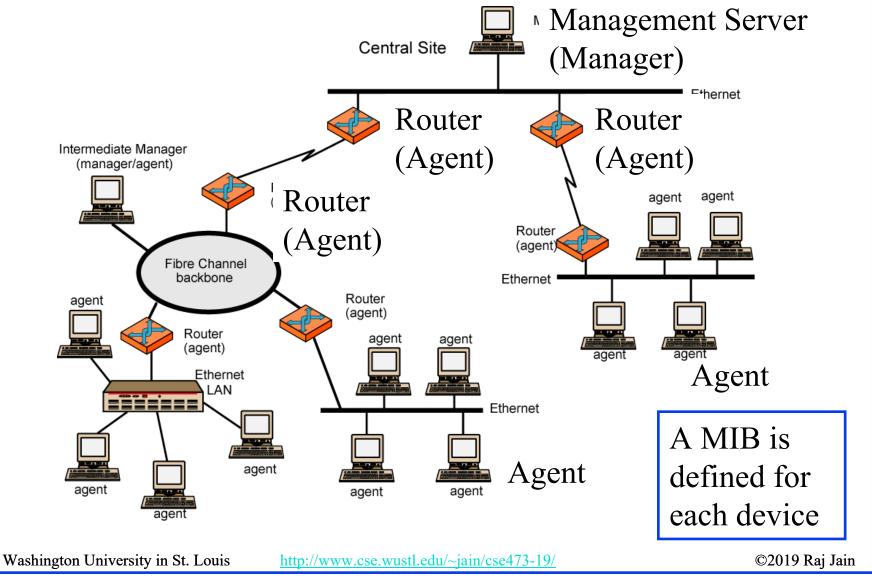

- □ Management = Initialization, Monitoring, Control
- Manager, Agents, andManagement Information Base (MIB)

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

# **Example of Network Management**

#### **SNMP**

- Based on Simple Gateway Management Protocol (SGMP) RFC 1028 Nov 1987
- □ SNMP = Simply Not My Problem [Marshall Rose]
  Simple Network Management Protocol
- □ RFC 1058, April 1988
- Only Five commands

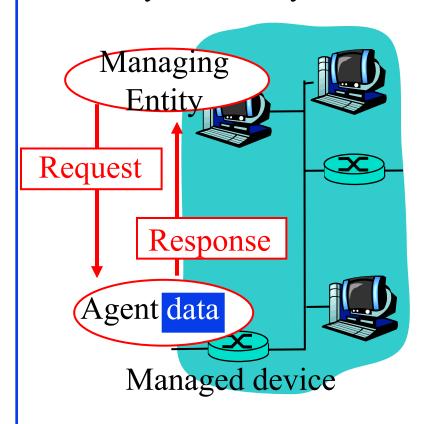

<b>Command</b>	Meaning
get-request	Fetch a value
get-next-request	Fetch the next value (in a tree)
get-response	Reply to a fetch operation
set-request	Store a value
trap	An event

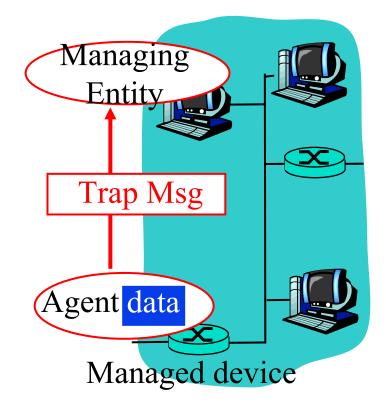

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

## **SNMP** protocol

Two ways to convey MIB info, commands:

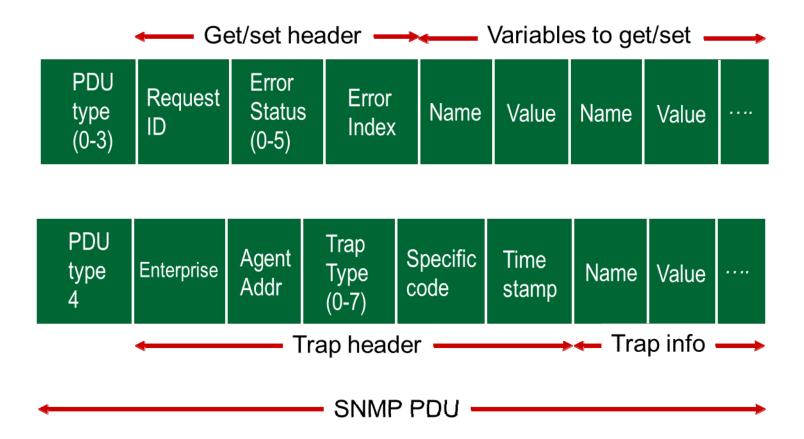

Request/response mode

Trap mode

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

#### **SNMP Message Formats**

# Network Management: Summary

- Management = Initialization, Monitoring, and Control
- 2. Standard MIBs defined for each object
- 3. SNMP = Only 5 commands in the first version

# **Network Layer Control Plane: Summary**

- 1. Dijkstra's algorithm allows path computation using link state
- 2. Bellman Ford's algorithm allows path computation using distance vectors.
- 3. OSPF is a link state IGP.
- 4. BGP is an EGP and uses path vectors
- 5. SDN controllers use various algorithms for centralized computation of path and other policies
- 6. ICMP is IP control protocol is used to convey errors
- 7. SNMP is the simple network management protocol to manage all devices and protocols in a network

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

# Lab 5B: ICMP Ping Programming

- [25 points] In this lab, you will gain a better understanding of Internet Control Message Protocol (ICMP). You will learn to implement a Ping application using ICMP request and reply messages.
- Ping is a computer network application used to test whether a particular host is reachable across an IP network. It is also used to self-test the network interface card of the computer or as a latency test. It works by sending ICMP "echo reply" packets to the target host and listening for ICMP "echo reply" replies. The "echo reply" is sometimes called a pong. Ping measures the round-trip time, records packet loss, and prints a statistical summary of the echo reply packets received (the minimum, maximum, and the mean of the round-trip times and in some versions the standard deviation of the mean).
- Your task is to develop your own Ping application in Python. Your application will use ICMP but, in order to keep it simple, will not exactly follow the official specification in RFC 1739. Note that you will only need to write the client side of the program, as the functionality needed on the server side is built into almost all operating systems.
- You should complete the Ping application so that it sends ping requests to a specified host separated by approximately one second. Each message contains a payload of data that includes a timestamp. After sending each packet, the application waits up to one second to receive a reply. If one second goes by without a reply from the server, then the client assumes that either the ping packet or the pong packet was lost in the network (or that the server is down).

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

#### Code

Below you will find the skeleton code for the client. You are to complete the skeleton code. <u>The places where you need to fill in code are marked with</u> **#Fill in start** and **#Fill in end**. Each place may require one or more lines of code. This code was written for Python V2.7 and may not run on higher versions.

#### **Additional Notes**

In "receiveOnePing" method, you need to receive the structure ICMP\_ECHO\_REPLY and fetch the information you need, such as checksum, sequence number, time to live (TTL), etc. Study the "sendOnePing" method before trying to complete the "receiveOnePing" method.

You do not need to be concerned about the checksum, as it is already given in the code.

This lab requires the use of raw sockets. In some operating systems, you may need administrator/root privileges to be able to run your Pinger program.

#### **Testing the Pinger**

First, test your client by sending packets to localhost, that is, 127.0.0.1.

Then, you should see how your Pinger application communicates across the network by pinging servers in different continents.

#### What to Hand in

You will hand in the complete client code and screenshots of your Pinger output for four target hosts: north-america.pool.ntp.org, europe.pool.ntp.org, asia.pool.ntp.org,

south-america.pool.ntp.org Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

#### **Skeleton Python Code for the ICMP Pinger**

```
from socket import *
import os
import sys
import struct
import time
import select
import binascii
ICMP ECHO REQUEST = 8
def checksum(string):
     csum = 0
     countTo = (len(string) // 2) * 2
     count = 0
     while count < countTo:
              this Val = ord(string[count+1]) * 256 + ord(string[count])
              csum = csum + thisVal
              csum = csum & 0xffffffff
              count = count + 2
     if countTo < len(string):
              csum = csum + ord(string[len(string) - 1])
              csum = csum & 0xffffffff
     csum = (csum >> 16) + (csum & 0xffff)
     csum = csum + (csum >> 16)
     answer = \simcsum
     answer = answer & 0xffff
     answer = answer >> 8 | (answer << 8 & 0xff00)
     return answer
```

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/cse473-19/

```
def receiveOnePing(mySocket, ID, timeout, destAddr):
   timeLeft = timeout
   while 1:
         startedSelect = time.time()
         whatReady = select.select([mySocket], [], [], timeLeft)
         howLongInSelect = (time.time() - startedSelect)
         if whatReady[0] == []: # Timeout
                   return "Request timed out."
         timeReceived = time.time()
         recPacket, addr = mySocket.recvfrom(1024)
         #Fill in start
         #Fetch the ICMP header from the IP packet
         #Fill in end
         timeLeft = timeLeft - howLongInSelect
         if timeLeft \leq 0:
                   return "Request timed out."
```

```
def sendOnePing(mySocket, destAddr, ID):
    # Header is type (8), code (8), checksum (16), id (16), sequence (16)
    myChecksum = 0
    # Make a dummy header with a 0 checksum
    # struct -- Interpret strings as packed binary data
