Workload Characterization Techniques

Raj Jain Washington University in Saint Louis Saint Louis, MO 63130 Jain@cse.wustl.edu

These slides are available on-line at:

http://www.cse.wustl.edu/~jain/cse567-06/

Terminology

- Components and Parameter Selection
- Workload Characterization Techniques: Averaging, Single Parameter Histograms, Multi-parameter Histograms, Principal Component Analysis, Markov Models, Clustering
- Clustering Method: Minimum Spanning Tree, Nearest Centroid
 Problems with Clustering

Terminology

- User = Entity that makes the service request = Workload Unit or Workload component
- □ Workload components:
 - > Applications
 - > Sites
 - > User Sessions
- Workload parameters or Workload features: Measured quantities, service requests, or resource demands.
 For example: transaction types, instructions, packet sizes, source-destinations of a packet, and page reference pattern.

Components and Parameter Selection

- □ The workload component should be be at the SUT interface.
- Each component should represent as homogeneous a group as possible. Combining very different users into a site workload may not be meaningful.
- Domain of the control affects the component: Example: mail system designer are more interested in determining a typical mail session than a typical user session.
- Do not use parameters that depend upon the system, e.g., the elapsed time, CPU time.

Components (Cont)

□ Characteristics of service requests:

- > Arrival Time
- > Type of request or the resource demanded
- > Duration of the request
- > Quantity of the resource demanded, for example, pages of memory
- Exclude those parameters that have little impact.

Workload Characterization Techniques

- 1. Averaging
- 2. Single-Parameter Histograms
- 3. Multi-parameter Histograms
- 4. Principal Component Analysis
- 5. Markov Models
- 6. Clustering

Case Study: Program Usage in Educational Environments

			Coef. of
Data	Av	erage	Variation
CPU time (VAX- $11/780^{\text{TM}}$)	2.19	seconds	40.23
Elapsed time	73.90	seconds	8.59
Number of direct writes	8.20		53.59
Direct write bytes	10.21	kilobytes	82.41
Size of direct writes	1.25	kilobytes	
Number of direct reads	22.64		25.65
Direct read bytes	49.70	kilobytes	21.01
Size of direct reads	2.20	kilobytes	
Number of buffered writes	52.84		11.80
Buffered write bytes	978.04	bytes	9.98
Size of buffered writes	18.51	bytes	

□ High Coefficient of Variation

Characteristics of an Average Editing Session

			Coef. of
Data	Avera	ige	Variation
CPU time $(VAX-11/780)$	2.57	seconds	3.54
Elapsed time	265.45	seconds	2.34
Number of direct writes	19.74		4.33
Direct write bytes	13.46	Kilo-bytes	3.87
Size of direct writes	0.68	kilo-bytes	
Number of direct reads	37.77		3.73
Direct read bytes	36.93	Kilo-bytes	3.16
Size of direct reads	0.98	kilo-bytes	
Number of buffered writes	199.06		4.30
Buffered write bytes	3314.95 bytes	3.04	
Size of buffered writes	16.65	bytes	

Reasonable variation

Principal Component Analysis

- □ Key Idea: Use a weighted sum of parameters to classify the components.
- \Box Let x_{ij} denote the *i*th parameter for jth component.

 $y_j = \sum_{i=1}^n w_i x_{ij}$

- Principal component analysis assigns weights w_i's such that y_j's provide the maximum discrimination among the components.
- **\Box** The quantity y_i is called the principal factor.
- The factors are ordered. First factor explains the highest percentage of the variance.

Principal Component Analysis (Cont)

□ Statistically:

> The y's are linear combinations of x's:

$$\mathbf{y}_i = \sum_{j=1}^n \mathbf{a}_{ij} \mathbf{x}_j$$

Here, a_{ij} is called the loading of variable x_j on factor y_i .

The y's form an orthogonal set, that is, their inner product is zero:

$$\langle \mathbf{y}_{i}, \mathbf{y}_{j} \rangle = \sum_{k} a_{ik} a_{kj} = 0$$

This is equivalent to stating that y_i 's are uncorrelated to each other.

The y's form an ordered set such that y₁ explains the highest percentage of the variance in resource demands.

Washington	University	in St. Louis
0		

Finding Principal Factors

- □ Find the correlation matrix.
- □ Find the eigen values of the matrix and sort them in the order of decreasing magnitude.
- Find corresponding eigen vectors.
 These give the required loadings.

Obs.	Varia	ables	Normalize	d Variables	Principa	al Factors

Principal Component Example

Principal Component Example

Compute the mean and standard deviations of the variables:

Normalize the variables to zero mean and unit standard deviation. The normalized values x_s' and x_r' are given by:

r' –	$x_s - \bar{x}_s$	$x_s - 5352$
$x_s -$	s_{x_s}	1741
x' —	$x_r - \bar{x}_r$	$x_r - 4889$
$u_r - $	s_{x_r}	- <u>1380</u>

• Compute the correlation among the variables:

$$R_{x_s,x_r} = \frac{\frac{1}{n} \sum_{i=1}^n (x_{si} - \bar{x}_s)(x_{ri} - \bar{x}_r)}{s_{x_s} s_{x_r}} = 0.916$$

□ Prepare the correlation matrix:

$$\mathbf{C} = \left[\begin{array}{rrr} 1.000 & 0.916 \\ 0.916 & 1.000 \end{array} \right]$$

 Compute the eigen values of the correlation matrix: By solving the characteristic equation:

$$|\lambda I - C| = \begin{vmatrix} \lambda - 1 & -0.916 \\ -0.916 & \lambda - 1 \end{vmatrix} = 0$$
$$(\lambda - 1)^2 - 0.916^2 = 0$$

□ The eigen values are 1.916 and 0.084.

□ Compute the eigen vectors of the correlation matrix. The eigen vectors q_1 corresponding to λ_1 =1.916 are defined by the following relationship:

 $\{ C \} \{ q \}_1 = \lambda_1 \{ q \}_1$

or:

$$\begin{bmatrix} 1.000 & 0.916 \\ 0.916 & 1.000 \end{bmatrix} \times \begin{bmatrix} q_{11} \\ q_{21} \end{bmatrix} = 1.916 \begin{bmatrix} q_{11} \\ q_{21} \end{bmatrix}$$

or_:

□ Restricting the length of the eigen vectors to one:

$$\mathbf{q}_1 = \begin{bmatrix} \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} \end{bmatrix} \quad \mathbf{q}_2 = \begin{bmatrix} \frac{1}{\sqrt{2}} \\ -\frac{1}{\sqrt{2}} \end{bmatrix}$$

Obtain principal factors by multiplying the eigen vectors by the normalized vectors:

$$\begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = \begin{bmatrix} \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} \end{bmatrix} \begin{bmatrix} \frac{x_s - 5352}{1741} \\ \frac{x_r - 4889}{1380} \end{bmatrix}$$

- □ Compute the values of the principal factors.
- Compute the sum and sum of squares of the principal factors.

- □ The sum must be zero.
- □ The sum of squares give the percentage of variation explained.

Markov Models

□ Markov

 \Rightarrow the next request depends only on the last request

Described by a transition matrix:

From/To	CPU	Disk	Terminal	1
CPU	0.6	0.3	0.1	
Disk	0.9	0	0.1	CPU
Terminal	1	0	0	0.6

- Transition matrices can be used also for application transitions.
 E.g., P(Link|Compile)
- Used to specify page-reference locality.
 P(Reference module *i* | Referenced module *j*)

Terminals

0.3

0.9

0.1

Disks

Transition Probability

- Given the same relative frequency of requests of different types, it is possible to realize the frequency with several different transition matrices.
- □ If order is important, measure the transition probabilities directly on the real system.
- □ Example: Two packet sizes: Small (80%), Large (20%)
 - An average of four small packets are followed by an average of one big packet, e.g., ssssbssssbssss.

Current	Next]	packet
Packet	Small	Large
Small	0.75	0.25
Large	1	0

Transition Probability (Cont)

> Eight small packets followed by two big packets.

Current	Next j	packet
Packet	Small	Large
Small	0.875	0.125
Large	0.5	0.5

Generate a random number *x*. $x \le 0.8 \Rightarrow$ generate a small packet;

otherwise generate a large packet.

Clustering Steps

- 1. Take a sample, that is, a subset of workload components.
- 2. Select workload parameters.
- 3. Select a distance measure.
- 4. Remove outliers.
- 5. Scale all observations.
- 6. Perform clustering.
- 7. Interpret results.
- 8. Change parameters, or number of clusters, and repeat steps 3-7.
- 9. Select representative components from each cluster.

1. Sampling

- In one study, 2% of the population was chosen for analysis; later 99% of the population could be assigned to the clusters obtained.
- □ Random selection
- □ Select top consumers of a resource.

2. Parameter Selection

Criteria:

- > Impact on performance
- > Variance
- □ Method: Redo clustering with one less parameter
- Principal component analysis: Identify parameters with the highest variance.

3. Transformation

□ If the distribution is highly skewed, consider a function of the parameter, e.g., log of CPU time

4. Outliers

- Outliers = data points with extreme parameter values
- □ Affect normalization
- □ Can exclude only if that do not consume a significant portion of the system resources. Example, backup.

5. Data Scaling

1. Normalize to Zero Mean and Unit Variance:

$$x_{ik}' = \frac{x_{ik} - \bar{x}_k}{s_k}$$

2. Weights:

$$\mathbf{x}_{ik}' = \mathbf{w}_k \mathbf{x}_{ik}$$

 $w_k \propto \text{relative importance or } w_k = 1/s_k$

3. Range Normalization:

$$x'_{ik} = \frac{x_{ik} - x_{min,k}}{x_{max,k} - x_{min,k}}$$

Affected by outliers.

Data Scaling (Cont)

Percentile Normalization:

$$x'_{ik} = \frac{x_{ik} - x_{2.5,k}}{x_{97.5,k} - x_{2.5,k}}$$

Washington University in St. Louis

Distance Metric

1. Euclidean Distance: Given $\{x_{i1}, x_{i2}, ..., x_{in}\}$ and $\{x_{j1}, x_{j2}, ..., x_{jn}\}$

$$d = \{\sum_{k=1}^{n} (x_{ik} - x_{jk})^2\}^{0.5}$$

- 2. Weighted-Euclidean Distance: $d=\sum_{k=1}^{n} \{a_k(x_{ik}-x_{jk})^2\}^{0.5}$ Here a_k , k=1,2,...,n are suitably chosen weights for the n parameters.
- 3. Chi-Square Distance:

$$d = \sum_{k=1}^{n} \left\{ \frac{(x_{ik} - x_{jk})^2}{x_{ik}} \right\}$$

Distance Metric (Cont)

- □ The Euclidean distance is the most commonly used distance metric.
- The weighted Euclidean is used if the parameters have not been scaled or if the parameters have significantly different levels of importance.
- Use Chi-Square distance only if x_{.k}'s are close to each other. Parameters with low values of x_{.k} get higher weights.

Clustering Techniques

- Goal: Partition into groups so the members of a group are as similar as possible and different groups are as dissimilar as possible.
- Statistically, the intragroup variance should be as small as possible, and inter-group variance should be as large as possible.

Total Variance = Intra-group Variance + Inter-group Variance

Clustering Techniques (Cont)

- Nonhierarchical techniques: Start with an arbitrary set of k clusters, Move members until the intra-group variance is minimum.
- □ Hierarchical Techniques:
 - > Agglomerative: Start with n clusters and merge
 - > Divisive: Start with one cluster and divide.
- **Two popular techniques:**
 - > Minimum spanning tree method (agglomerative)
 - > Centroid method (Divisive)

Minimum Spanning Tree-Clustering Method

- 1. Start with k = n clusters.
- 2. Find the centroid of the i^{th} cluster, i=1, 2, ..., k.
- 3. Compute the inter-cluster distance matrix.
- 4. Merge the the nearest clusters.
- 5. Repeat steps 2 through 4 until all components are part of one cluster.

Minimum Spanning Tree Example

Program	CPU Time	Disk I/O
A	2	4
В	3	5
\mathbf{C}	1	6
D	4	3
${ m E}$	5	2

- Step 1: Consider five clusters with ith cluster consisting solely of ith program.
- ❑ Step 2: The centroids are {2, 4}, {3, 5}, {1, 6}, {4, 3}, and {5, 2}.

Spanning Tree Example (Cont)

□ Step 3: The Euclidean distance is:

			Progr	am	
Program	A	В	С	D	Ε
А	0	$\sqrt{2}$	$\sqrt{5}$	$\sqrt{5}$	$\sqrt{13}$
В		0	$\sqrt{5}$	$\sqrt{5}$	$\sqrt{13}$
\mathbf{C}			0	$\sqrt{18}$	$\sqrt{32}$
D				0	$\sqrt{2}$
${ m E}$					0

□ Step 4: Minimum inter-cluster distance = $\sqrt{2}$. Merge A+B, D+E.

Spanning Tree Example (Cont)

 Step 3: The distance matrix is: Program Program ABC DE 0 Step 4: Minimum distance is 12.5. Merge ABC and DE ⇒ Single Custer ABCDE Washington University in St. Louis CE567M 	Spanning Tree Example (Cont)					
ProgramProgramABC \overline{DE} ABC 0 $\sqrt{12.5}$ DE 0	□ Step 3: The distance matrix is:					
Washington University in St. Louis CSE567M ©2006 Raj Jain	Program ABC DE ABC 0 $\sqrt{12.5}$ DE 0 Step 4: Minimum distance is 12.5. Merge ABC and DE \Rightarrow Single Custer ABCDE					
	Washington University in St. Louis CSE567M	©2006 Raj Jain				

Nearest Centroid Method

- □ Start with k = 1.
- □ Find the centroid and intra-cluster variance for i^{th} cluster, i=1, 2, ..., k.
- □ Find the cluster with the highest variance and arbitrarily divide it into two clusters.
- □ Find the two components that are farthest apart, assign other components according to their distance from these points.
- Place all components below the centroid in one cluster and all components above this hyper plane in the other.
- Adjust the points in the two new clusters until the inter-cluster distance between the two clusters is maximum.
- □ Set k = k+1. Repeat steps 2 through 4 until k = n.

Cluster Interpretation

- □ Assign all measured components to the clusters.
- Clusters with very small populations and small total resource demands can be discarded.

(Don't just discard a small cluster)

- Interpret clusters in functional terms, e.g., a business application, Or label clusters by their resource demands, for example, CPU-bound, I/O-bound, and so forth.
- Select one or more representative components from each cluster for use as test workload.

Problems with Clustering (Cont)

- Goal: Minimize variance.
- The results of clustering are highly variable. No rules for:
 - Selection of parameters
 - > Distance measure
 - Scaling
- □ Labeling each cluster by functionality is difficult.
 - > In one study, editing programs appeared in 23 different clusters.
- □ Requires many repetitions of the analysis.

- Workload Characterization = Models of workloads
- Averaging, Single parameter histogram, multi-parameter histograms, ...
- Principal component analysis consists of finding parameter combinations that explain the most variation
- Clustering: divide workloads in groups that can be represented by a single benchmark

Exercise 6.1

The CPU time and disk I/Os of seven programs are shown in Table below. Determine the equation for principal factors.

Program Name	Function	CPU Time	Number of I/Os
TKB	Linker	14	2735
MAC	Assembler	13	253
COBOL	Compiler	8	27
BASIC	Compiler	6	27
PASCAL	Compiler	6	12
EDT	Text Editor	4	91
SOS	Text Editor	1	33

 Table 1: Data for Principal Component Exercise

Exercise 6.2

 Using a spanning-tree algorithm for cluster analysis, prepare a Dendogram for the data shown in Table below. Interpret the result of your analysis.

Program Name	Function	CPU Time	Number of I/Os
TKB	Linker	14	2735
MAC	Assembler	13	253
COBOL	Compiler	8	27
BASIC	Compiler	6	27
PASCAL	Compiler	6	12
EDT	Text Editor	4	91
SOS	Text Editor	1	33

Table 1: Data for Principal Component Exercise

Homework □ Read chapter 6 □ Submit answers to exercises 6.1 and 6.2
