Model

- Computation of Effects
- Estimating Experimental Errors
- □ Allocation of Variation
- □ ANOVA Table and F-Test
- Confidence Intervals For Effects

Model Replications allow separating out the interactions from experimental errors. Model: With *r* replications $y_{ijk} = \mu + \alpha_j + \beta_i + \gamma_{ij} + e_{ijk}$ Response in the kth replication ${}^{\iota}y_{ijk}$ with factor A at level j and factor B at level i = mean response $[\mu]$ α_j = Effect of factor A at level j β_i = Effect of Factor B at level i γ_{ij} = Effect of interaction between factors A and B = Experimental error e_{ijk}

Model (Cont) The effects are computed so that their sum is zero: $\sum_{i=1}^{a} \alpha_i = 0; \sum_{i=1}^{b} \beta_i = 0;$ The interactions are computed so that their row as well as column sums are zero: $\sum_{j=1}^{a} \gamma_{1j} = \sum_{j=1}^{a} \gamma_{2j} = \dots = \sum_{j=1}^{a} \gamma_{bj} = 0$ $\sum_{i=1}^{b} \gamma_{i1} = \sum_{i=1}^{b} \gamma_{i2} = \dots = \sum_{i=1}^{b} \gamma_{ia} = 0$ The errors in each experiment add up to zero: $\sum e_{ijk} = 0 \quad \forall i, j$ k=1Washington University in St. Louis CSE567M ©2006 Rai Jain 22-4

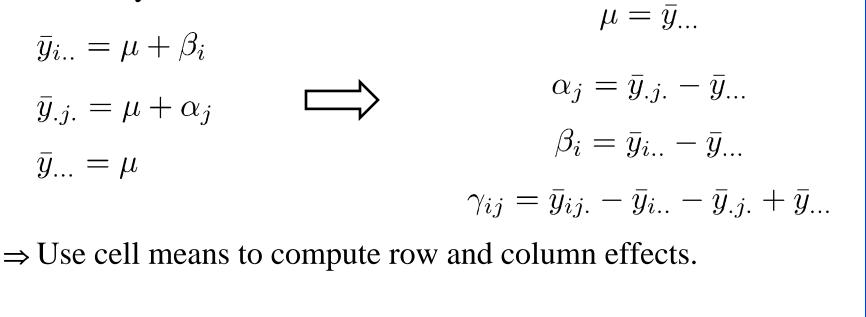

Computation of Effects

 $y_{ijk} = \mu + \alpha_j + \beta_i + \gamma_{ij} + e_{ijk}$

□ Averaging the observations in each cell:

$$\bar{y}_{ij.} = \mu + \alpha_j + \beta_i + \gamma_{ij}$$

□ Similarly,

- ❑ An average workload on an average processor requires a code size of 10^{3.94} (8710 instructions).
- □ Processor W requires $10^{0.23}$ (=1.69) less code than avg processor.
- Processor X requires 10^{0.02} (=1.05) less than an average processor and so on.
- □ The ratio of code sizes of an average workload on processor W and X is $10^{0.21}$ (= 1.62).

Washington University in St. Louis

CSE567M

Example 22.1: Interactions

Workloads	W	Х	Y	Ζ
Ι	-0.0212	0.0155	0.0032	0.0024
J	0.0399	0.0333	-0.1069	0.0337
Κ	-0.0447	0.0475	-0.0051	0.0023
\mathbf{L}	0.0564	-0.1168	0.1054	-0.0450
Μ	-0.0305	0.0205	0.0033	0.0066

- □ Check: The row as well column sums of interactions are zero.
- Interpretation: Workload I on processor W requires 0.02 less log code size than an average workload on processor W or equivalently 0.02 less log code size than I on an average processor.

Washington University in St. Louis

Computation of Errors

Estimated Response:

$$\hat{y}_{ij} = \mu + \alpha_j + \beta_i + \gamma_{ij} = \bar{y}_{ij}.$$

□ Error in the *k*th replication:

 $e_{ijk} = y_{ijk} - \bar{y}_{ij.}$

 Example 22.2: Cell mean for (1,1) = 3.8427 Errors in the observations in this cell are: 3.8455-3.8427 = 0.0028
3.8191-3.8427 = -0.0236, and
3.8634-3.8427 = 0.0208 Check: Sum of the three errors is zero.

Example 22.5: Code Size Study

□ From ANOVA table: $s_e=0.03$. The standard deviation of processor effects:

$$s_{\alpha_j} = s_e \sqrt{\frac{a-1}{abr}} = 0.03 \sqrt{\frac{4-1}{4 \times 5 \times 3}} = 0.0060$$

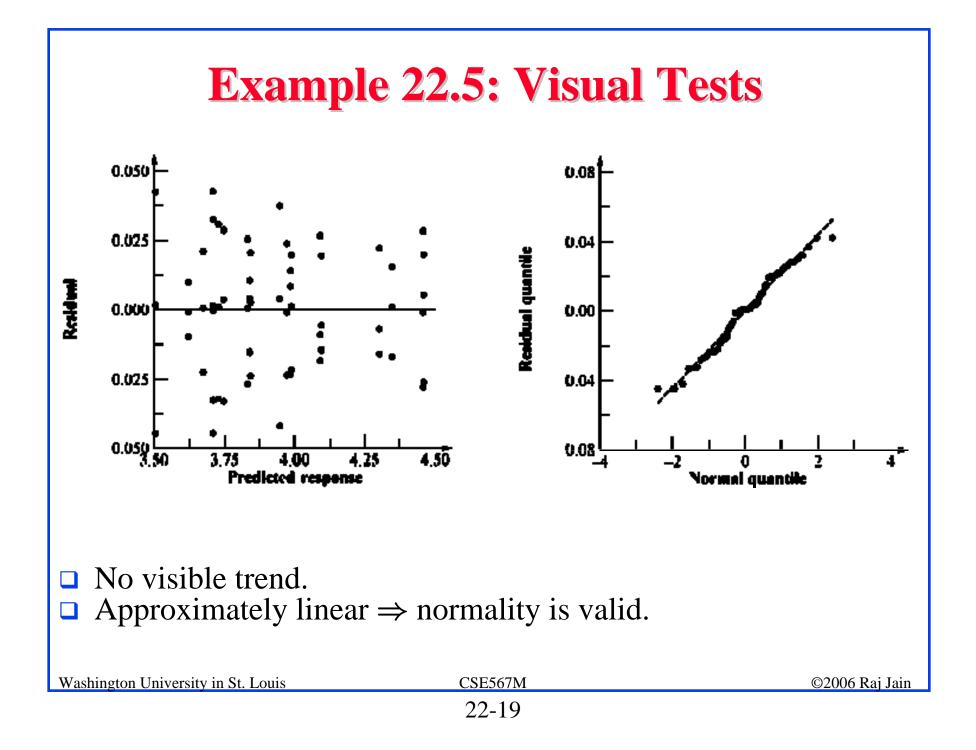

■ The error degrees of freedom: $ab(r-1) = 40 \Rightarrow$ use Normal tables For 90% confidence, $z_{0.95} = 1.645$ 90% confidence interval for the effect of processor W is: $\alpha_1 \mp t s_{\alpha_1} = -0.2304 \mp 1.645 \times 0.0060$ $= -0.2304 \mp 0.00987$ = (-0.2406, -0.2203)The effect is significant.

Exercise 22.1

Measured CPU times for three processors A1, A2, and A3, on five workloads B1, B2, through B5 are shown in the table. Three replications of each experiment are shown. Analyze the data and answer the following:

- > Are the processors different from each other at 90% level of confidence?
- What percent of variation is explained by the processor-workload interaction?
- > Which effects in the model are not significant at 90% confidence.

		А
