#### **General Full Factorial Designs With k Factors**

 $\Box$  Model: k factors  $\Rightarrow$  2<sup>k</sup>-1 effects k main effects  $\begin{pmatrix} k \\ 2 \end{pmatrix}$  two factor interactions,  $\begin{pmatrix} k \\ 3 \end{pmatrix}$  three factor interactions, and so on. Example: 3 factors A, B, C:  $y_{ijkl} = \mu + \alpha_i + \beta_j + \xi_k + \gamma_{ABij} + \gamma_{ACik} + \gamma_{BCjk} +$  $+\gamma_{ABCijk} + e_{ijkl}$  $i = 1, \dots, a; \quad j = 1, \dots, b; \quad k = 1, \dots, c; \quad l = 1, \dots, r;$ http://www.cse.wustl.edu/~jain/cse567-13/ Washington University in St. Louis ©2013 Rai Jain 23 - 3

### **Model Parameters**

 $y_{ijkl}$  = Response in the lth replication with factors A, B, and C at levels i, j, and k, respectively.

$$\mu$$
 = Mean response

- $\alpha_i$  = Effect of factor A at level i
- $\beta_j$  = Effect of factor B at level j
- $\xi_k$  = Effect of factor C at level k
- $\gamma_{ABij}$  = Interaction between A and B at levels i and j.
- $\gamma_{ABCijk}$  = Interaction between A, B, C at levels i, j, and k. and so on
- □ Analysis: Similar to that with two factors

$$\mu = \bar{y}_{\dots}$$

$$\alpha_i = \bar{y}_{i\dots} - \bar{y}_{\dots}$$

The sums of squares, degrees of freedom, and F-test also extend as expected. }

### **Example 23.1: Conclusions**

To get high throughput for word processing jobs,:

- 1. There should not be any preemption (A=-1)
- 2. The time slice should be large (B=1)
- 3. The fairness should be on (E=1)
- 4. The settings for queue assignment and re-queueing do not matter.

#### **Ranking Method**

#### □ Sort the experiments.

	No.	А	В	$\mathbf{C}$	D	${ m E}$	$T_W$	$T_I$	$T_B$
	7	-1	1	1	-1	1	28.0	36.3	20.2
	11	-1	1	-1	1	1	27.0	34.6	15.7
	15	-1	1	1	1	-1	25.0	35.0	17.2
	3	-1	1	-1	-1	-1	25.0	36.0	21.0
	1	-1	-1	-1	-1	1	15.0	25.0	15.2
	5	-1	-1	1	-1	-1	14.0	63.9	7.5
	9	-1	-1	-1	1	-1	14.0	66.1	6.4
	13	-1	-1	1	1	1	14.0	26.0	12.0
	2	1	-1	-1	-1	-1	11.0	41.0	3.0
	8	1	1	1	-1	-1	11.0	23.0	3.0
	12	1	1	-1	1	-1	11.0	23.0	3.0
	14	1	-1	1	1	-1	11.0	38.0	2.0
	16	1	1	1	1	1	11.0	22.0	2.0
	6	1	-1	1	-1	1	10.0	13.2	7.5
	4	1	1	-1	-1	1	10.0	15.7	8.6
	10	1	-1	-1	1	1	10.0	9.1	8.4
Washington Universi	ity in St. Lou	is		http://ww	ww.cse.	wustl.edu	/~jain/cse	567-13/	
					<b>a a a a</b>	<u> </u>			

### **Example 23.2: Conclusions**

- 1. A=-1 (no preemption) is good for word processing jobs and also that A=1 is bad.
- 2. B=1 (large time slice) is good for such jobs. No strong negative comment can be made about B=-1.
- 3. Given a choice C should be chosen at 1, that is, there should be two queues.
- 4. The effect of E is not clear.
- 5. If top rows chosen, then E=1 is a good choice.

## **Range Method**

- □ Range = Maximum-Minimum
- □ Factors with large range are important.

		Level		Range of
Factor	1	2	3	of Averages
Replacement Algorithm	2056	2986	3781	1725
Deck Arrangement	1584	2913	4326	2742
Problem Program	592	2047	6185	5593
Memory Size	305	2006	6512	6207

- □ Memory size is the most influential factor.
- Problem program, deck arrangement, and replacement algorithm are next in order.

- □ A general k factor design can have k main effects, two factor interactions, three factor interactions, and so on.
- □ Information Methods:
  - > Observation: Find the highest or lowest response
  - Ranking: Sort all responses
  - Range: Largest smallest average response

#### **Homework 23** □ Analyze the following results using observation and ranking methods.
