

# Recent Trends in Networking

Raj Jain  
Washington University in Saint Louis  
Saint Louis, MO 63130  
Jain@cse.wustl.edu

These slides and audio/video recordings of this class lecture are at:  
<http://www.cse.wustl.edu/~jain/cse570-19/>

1. Virtualization
2. Edge Computing
3. Disaggregation
4. Black Box to White Box
5. Decomposition
6. Microservices on Bare Metal
7. Intent-Based Policy Management
8. CI/CD
9. Reactive to Proactive
10. Standards to Open Source Software
11. Self-Driving Networks

# Trend: Virtualization

- ❑ Started with virtual memory ⇒ virtual disk ⇒ Virtual Compute  
⇒ Virtual Networks ⇒ Virtual Machines ⇒ Clouds  
⇒ Virtual Network Functions ⇒ NFV ⇒ Micro-Services

# Computing vs. Networking: Speed

□ Moore's Law  $\Rightarrow$  Compute power grew 2x every 18 months

$\Rightarrow$  Memory size grew 2x every 18 months

Amdahl's Law: 1 Bit i/o per instruction

$\Rightarrow$  I/O grew 2x every 18 months

$\Rightarrow$  Networking speeds need to grow 2x every 18 months

$\Rightarrow$  10 Mbps Ethernet in 1980 to 400 Gbps in 2018

$\Rightarrow$  40,000x in 38 years  $\Rightarrow$  2x every 30 months

$\Rightarrow$  Network is still the bottleneck

# The Magic Word $\alpha$

# Distance-B/W Principle

- ❑ Efficiency = Max throughput/Media bandwidth
- ❑ Efficiency is a decreasing function of  $\alpha$   
 $\alpha = \text{Propagation delay} / \text{Transmission time}$   
 $= (\text{Distance} / \text{Speed of signal}) / \{(\text{Transmission size} / \text{Bits/sec})\}$   
 $= \text{Distance} \times \text{Bits/sec} / \{(\text{Speed of signal})(\text{Transmission size})\}$
- ❑ Bit rate-distance-transmission size tradeoff.
- ❑ 100 Mb/s  $\Rightarrow$  Change distance or frame size

# Trend: Edge Computing

- ❑ Network protocols have the same performance as long as  $\alpha$  is same.
- ❑ Multiple short networks are more economical than one long network
- ❑ Multiple short networks can transport more bits than one long distance network  $\Rightarrow$  Small Cells  $\Rightarrow$  Edge computing

# Impact of High-Speed Networks

- ❑ Distance became inconsequential
  - ⇒ Globalization of information
  - ⇒ Globalization of trade
  - ⇒ Globalization of computing
- ❑ No need for local caching of information ⇒ Cloud storage
- ❑ No need for local computing ⇒ Cloud computing

# Trend: Disaggregation

- ❑ Disaggregation of software and hardware
- ❑ Software on any hardware  $\Rightarrow$  hardware can change  
Different software on a hardware  $\Rightarrow$  Software can change
- ❑ Open source software on commodity hardware

# Impact of High-Speed Hardware

- ❑ General purpose processors were fast enough for most computation
  - ⇒ No need for special purpose hardware
  - ⇒ All specialization and differentiation via software
  - ⇒ White box networking

# Trend: Black Box to White Box

- ❑ Black Box: Proprietary
- ❑ White Box: Open Source Hardware

# Network Operating Systems

- ❑ OpenNetworkLinux: Linux distribution for open switches. Part of OCP.
- ❑ OpenSwitch: Open Network Operating System for switches under Linux Foundation
- ❑ ONIE: Open Network Install Environment. Part of OCP.
- ❑ SONiC: Software for Open Networking in Cloud. Open “switch OS” from Microsoft to run on white box switches
- ❑ Cumulus Linux: Network OS
- ❑ Switch Light OS: Network OS from BigSwitch Network based on ONL
- ❑ Big Cloud Fabric: Datacenter switch controller
- ❑ Big Monitor Fabric: Network monitoring and Security from BigSwitch networks
- ❑ IP Infusion OcNOS: Network OS
- ❑ IXIA Vision Edge OS: Monitoring software for open switches
- ❑ Pica8 PicOS: Switch operating system based on XORP open router platform. It runs on a Linux kernel and provides network and switching services.
- ❑ Pluribus Open Netvisor Linux: Network OS from Pluribus. Partners with Dell open switches.
- ❑ SnapRoute FlexSwitch: Set of networking applications, e.g., ARP, DHCP, BGP, VLAN, written in Go by SnapRoute. Accelerated by hardware. Merged in to Open Network Linux at OCP.

<http://www.cse.wustl.edu/~jain/cse570-19/>

# White Box Switches

- ❑ EdgeCore Networks (ACTON)
- ❑ Quanta
- ❑ HPE
- ❑ DNI
- ❑ Dell
- ❑ Mellanox
- ❑ Delta Agema
- ❑ Celestica
- ❑ Alpha Networks
- ❑ Ingrasys
- ❑ Inventec
- ❑ Netberg

# ASICs for White Box Switches

- ❑ Broadcom, Marvell, Intel/Fulcrum, Mellanox
- ❑ P4 ASICs from Barefoot Networks, and Cavium (by Xplient acquisition)
- ❑ CPUs: Intel Rangeley, Freescale, ARM A9,

# Trend: Decomposition

- ❑ Decompose a large complex application in to microservices
- ❑ Each service implements a small set of strongly related functions
- ❑ Functions that change together should be packaged together
  - Can develop and deploy independent of other services
- ❑ Loosely coupled: API binds it to other services. The implementation can be changed without affecting the result.
- ❑ Measurable, Testable
- ❑ Decomposition by:
  - Subdomains/Departments: Inventory, Order, Delivery, ...
  - Capability:
- ❑ This allows some functions to be moved to Edge Computing

# Trend: Microservices on Bare Metal

- ❑ Clouds provide virtual machines
- ❑ There is trend against virtual machines
- ❑ Containers on bare metal  $\Rightarrow$  Kata Container

# Cloud Native Applications

- ❑ Applications that run on multi-cloud
- ❑ Run on multiple servers at different locations
- ❑ Must be decomposed to allow faults
- ❑ Applications assembled as microservices in linux containers
- ❑ Cloud Native Computing Foundation (CNCF) – Linux Foundation project

Ref: <https://searchitoperations.techtarget.com/definition/native-cloud-application-NCA>

# Serverless

- ❑ Don't need a local server. Just use cloud.
- ❑ Developers can work on an application without needing IT organization to provision hardware

# Intent-Based Policy Management

- ❑ Intent: Tell what you want done  
Not how you want it done  
Example: Tell phone where you want to go. Fastest time, Shortest path, highway, ...
- ❑ Invariance: Intent doesn't change if the network changes, devices fail, ...
- ❑ Portability: Independent of infrastructure, equipment vendors, service providers, protocols used, media used, ...
- ❑ Compose-ability: Can use any combination of infrastructure, ...
- ❑ Scalable: From one to billions. Single controllers aren't scalable.
- ❑ Action requires context: Actions need to adopt to sudden changes in infrastructure, ... ⇒ Rule-based, table-based approaches may not work
- ❑ Opendaylight has a new project on Network Intent Composition (NIC)

Ref: <https://www.sdxcentral.com/articles/contributed/network-intent-summit-perspective-david-lenrow/2015/02/>  
[https://wiki.opendaylight.org/view/Project\\_Proposals:Network\\_Intent\\_Composition](https://wiki.opendaylight.org/view/Project_Proposals:Network_Intent_Composition)

# Trend: CI/CD

- ❑ Continuous Integration/Continuous Delivery
- ❑ Developer to Operations (DevOps)

# Trend: Reactive to Proactive

- ❑ Past: Find failed components. Find why it failed?
- ❑ Now: Find components that will fail soon
- ❑ Anticipate what the future will be and act before it actually happens
- ❑ Causal Analysis: Why it failed

Which would you prefer?

Proactive

Helps protect you from drowning.

Reactive

Thrown to you after you're already drowning.

# Black Box AI to Transparent AI

- ❑ Machine learning is currently a blackbox
- ❑ ML algorithms are developed/used without domain expertise
- ❑ Data cleanliness, labeling, feature extractions, all require domain knowledge, e.g.,  
What is the distance between Port 80, Port 81, and Port 8080?
- ❑ Data Imbalance (1 in a million packet is an attack packet).
- ❑ Use Synthetic data is used  $\Rightarrow$  Garbage-In, Garbage-Out
- ❑ Results are stated without model validation.
- ❑ Explainability issue  $\Rightarrow$  No idea of why the results are what they are

# Standards are Slow

- ❑ Initially, Standards  $\Rightarrow$  Interoperability  
If all companies implemented the same standard in the same way, they could interoperate
- ❑ Standards=Compromises  $\Rightarrow$  We agree to disagree  
All differing opinions are part of the standard as option  
The standard is approved but different companies choose different options  
 $\Rightarrow$  No Interoperability
- ❑ Need Interoperability organizations
  - WiFi  $\Rightarrow$  Approves the subset of standard that is mandatory
- ❑ All this introduces delay  $\Rightarrow$  The standard is out of date when it is ready for implementation
- ❑ Example: IEEE 802.22-2011 Cognitive Radio (TV White spaces) Regional Area Networks. Started 2004. First standard in 2011. Revised in 2014.
- ❑ IEEE 802.11ah-2016 Long-Range WiFi for IoT. Started 2010. Taken over by competition: ZigBee, LoraWAN, ...
- ❑ Standards are static. Can't change quickly.

# Standards are not Open

- ❑ Open  $\Rightarrow$  Anyone can implement it without fee
- ❑ IETF allows “non-discriminatory and reasonable licensing fee”  
 $\Rightarrow$  Not really open
- ❑ Open Source Initiative (OSI) Criteria:
  - No intentional secrets
  - Free and publicly available
  - All patents must be royalty-free for unrestricted use
  - No license agreements, NDA, or paperwork to implement
  - Not dependent on non-open standards

# Trend: Open Source Software

- ❑ Standardization to Rough Consensus and Running Code
- ❑ IETF has ~100 working groups  
Open Linux Foundation has >100 open source networking projects. Their website can't be kept uptodate.
- ❑ 4 Opens:
  - Open Source
  - Open Design
  - Open Development
  - Open Community

# Trend 11: Managed to Self-Driven Networks

- ❑ **Self-Discover:** Find its components
- ❑ **Self-Organize and Self-configure:** Trending. Predict.
- ❑ **Auto-Manage** = Auto-BSS (bill)/Auto-OSS (provision)
- ❑ **Self-Monitor:** Counters and Probes. Telemetry
- ❑ **Self-Diagnose and Self-Heal:** Self-Report to human operator

**Network Manager**

# Summary

| #  | Past                      | Present/Future               |
|----|---------------------------|------------------------------|
| 1  | SDN                       | Disaggregation               |
|    | Proprietary Black Boxes   | Standardized White Boxes     |
| 2  | Control                   | Orchestration                |
| 3  | Clouds                    | Micro-Clouds                 |
| 4  | Core                      | Edge                         |
| 5  | Services                  | Micro-services               |
| 6  | Orchestration of Switches | Orchestration of Multi-Cloud |
| 7  | Virtualization            | Containerization             |
| 8  | Standards                 | Open-Source SW               |
| 9  | Centralized               | Distributed                  |
| 10 | Smart                     | Intelligent                  |
| 11 | Managed                   | Self-Driven                  |
