SDN and NFV: Facts, Extensions, and Carrier Opportunities

Project Leader: Subharthi Paul Washington University in Saint Louis Saint Louis, MO 63130, Jain@cse.wustl.edu AT&T SDN Forum Seminar, April 10, 2014 These slides and audio/video recordings of this talk are at: http://www.cse.wustl.edu/~jain/talks/adn_att.htm

- 1. SDN 1.0 and SDN 2.0
- 2. Network Function Virtualization and Service Chaining
- 3. Function Virtualization and Service Chaining
- 4. Cloud of Clouds

Planes of Networking

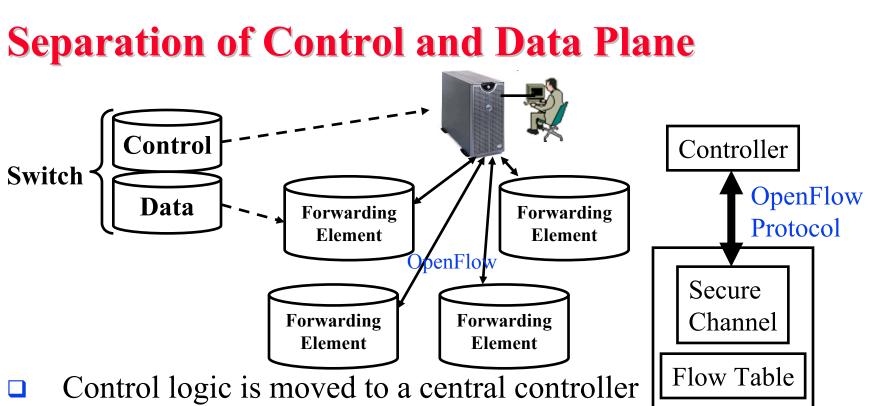

- Data Plane: All activities involving as well as resulting from data packets sent by the end user, e.g.,
 - Forwarding
 - > Fragmentation and reassembly
 - Replication for multicasting
- □ **Control Plane**: All activities that are <u>necessary</u> to perform data plane activities but do not involve end-user data packets
 - Making routing tables
 - Setting packet handling policies (e.g., security)

Dest.	Output Port	Next Hop

- Switches only have forwarding elements
- One expensive controller with a lot of cheap switches
- OpenFlow is the protocol to send/receive forwarding rules from controller to switches
- By programming the controller, we can quickly change the entire network behavior \Rightarrow Software Defined Networking

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/talks/adn_att.htm_

ONF Definition of SDN

"What is SDN?

The physical separation of the network control plane from the forwarding plane, and where a control plane controls several devices."

- 1. Directly programmable
- 2. Agile: Abstracting control from forwarding
- 3. Centrally managed
- 4. Programmatically configured
- 5. Open standards-based vendor neutral

The above definition includes *How*. Now many different opinions about *How*. ⇒SDN has become more general. Need to define by *What*?

What do We need SDN for?

- **1. Virtualization**: Use network resource without worrying about where it is physically located, how much it is, how it is organized, etc.
- **2. Orchestration**: Manage thousands of devices
- **3. Programmable**: Should be able to change behavior on the fly.
- 4. Dynamic Scaling: Should be able to change size, quantity
- **5. Automation**: Lower OpEx
- 6. Visibility: Monitor resources, connectivity
- 7. Performance: Optimize network device utilization
- 8. Multi-tenancy: Sharing expensive infrastructure
- **9. Service Integration**
- **10. Openness:** Full choice of Modular plug-ins
- 11. Unified management of computing, networking, and storage

SDN 2.0: OpenDaylight Style SDN

NO-OpenFlow (Not Only OpenFlow) Multi-Protocol
 New work in IETF XMPP, ALTO, I2RS, PCEP,
 Linux Foundation

Networking and Religion

Both are based on a set of beliefs

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/talks/adn att.htm

Current SDN Debate: What vs. How?

- SDN is easy if control plane is centralized but not necessary.
 Distributed solutions may be required for legacy equipment and for fail-safe operation.
- Complete removal of control plane may be harmful.
 Exact division of control plane between centralized controller and distributed forwarders is yet to be worked out
- SDN is easy with a standard southbound protocol like OpenFlow but one protocol may not work/scale in all cases
 - > Diversity of protocols is a fact of life.
 - There are no standard operating systems, processors, routers, or Ethernet switches.
- If industry finds an easier way to solve the same problems by another method, that method may win. E.g., ATM vs. MPLS.

Separation vs. Centralization

Separation of Control Plane

Centralization of Control

Washington University in St. Louis

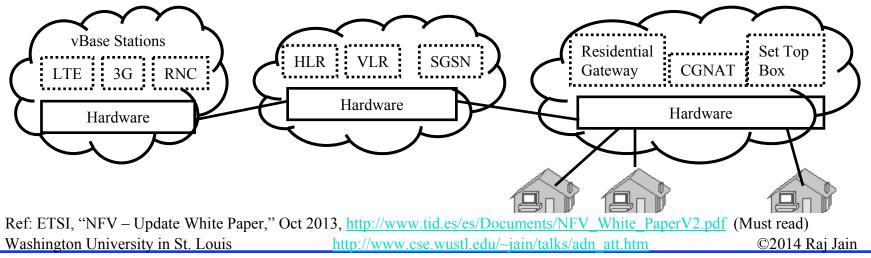

http://www.cse.wustl.edu/~jain/talks/adn att.htm

Network Function Virtualization (NFV)

 Fast standard hardware ⇒ Software based Devices Routers, Firewalls, Broadband Remote Access Server (BRAS) ⇒ A.k.a. *white box* implementation

2. Virtual Machine implementation

 \Rightarrow Virtual appliances \Rightarrow All advantages of virtualization (quick provisioning, scalability, mobility, Reduced CapEx, Reduced OpEx, ...)

What can NFV do?

- **1. Virtualization**: Use network resource without worrying about where it is physically located, how much it is, how it is organized, etc.
- 2. Orchestration: Manage thousands of devices
- **3. Programmable**: Should be able to change behavior on the fly.
- 4. Dynamic Scaling: Should be able to change size, quantity
- **5.** Automation
- 6. Visibility: Monitor resources, connectivity
- 7. Performance: Optimize network device utilization
- 8. Multi-tenancy
- 9. Service Integration
- 10. Openness: Full choice of Modular plug-ins

Note: These are exactly the **same** reasons why we need SDN.

Service-Infrastructure Separation

- □ With cloud computing, anyone can super-compute on demand.
 - Physical infrastructure is owned by Cloud Service Provider (CSP). Tenants get virtual infrastructure
 - > Win-Win combination
- With virtualization, an ISP can set up all virtual resources on demand
 - > Physical Infrastructure owned by NFV infrastructure service provider (NSP) and tenant ISPs get virtual NFVI services
 - > Win-Win combination

15

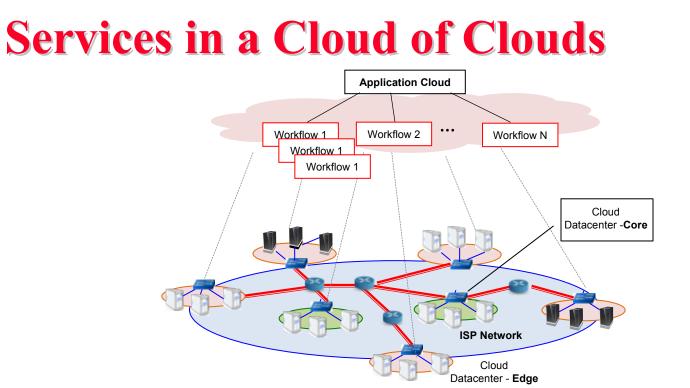

Service Chaining in a Multi-Cloud Multi-Tenant Environment

- □ VNFs (Virtual network fns) belong to tenants. Multiple tenants.
- □ Each Cloud belongs to a different Cloud Service Provider (CSP)
- □ Internet infrastructure belongs to an NFVI service provider (NSP)
- □ Service chain = Workflow

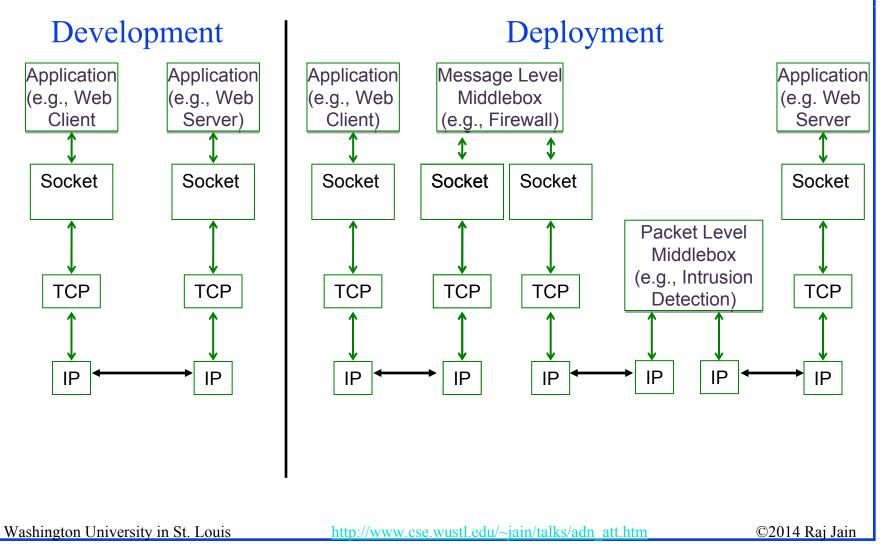

Any Function Virtualization (FV)

- Network function virtualization of interest to Network service providers
- But the same concept can be used by any other industry, e.g., financial industry, banks, stock brokers, retailers, mobile games, ...
- Everyone can benefit from:
 - Functional decomposition of there industry
 - Virtualization of those functions
 - ≻ Service chaining those virtual functions (VFs)
 ⇒ A service provided by the next gen ISPs

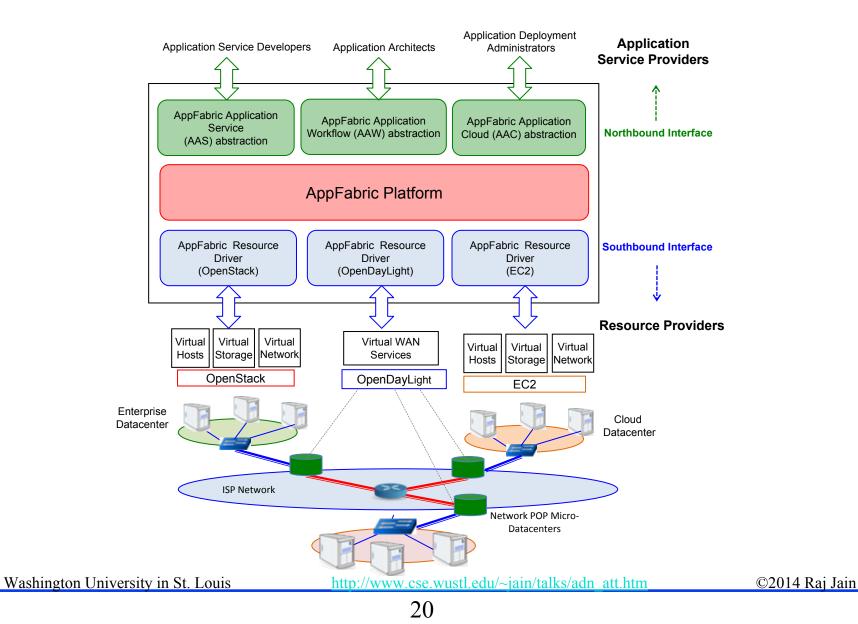

- □ Need to add/delete workflows as the load/locality changes
- □ Application **Developers** designing a workflow need not be aware of middleboxes, physical resources.
- Application Architects set guidelines for creation of new workflows including middleboxes
- Deployment Administrators set policies for quantity and location of resources inside various clouds.
- Also need to virtualize wide area networks just as it is done inside the clouds today
 Washington University in St. Louis

Workflow Example

19

Services in a Cloud of Clouds

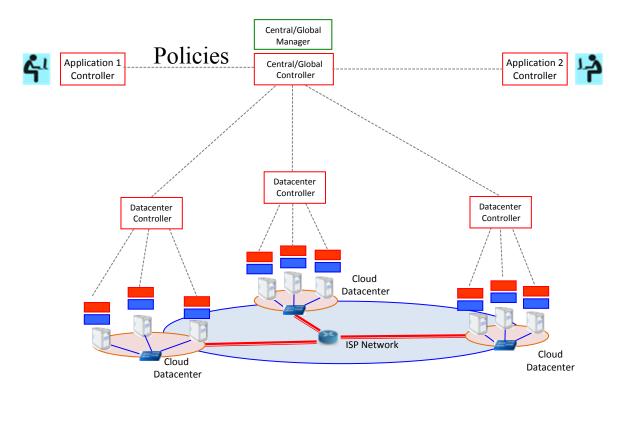

AppFabric Features

- Allows application architects to specify guidelines for creation of new workflows including middleboxes
- Allows application developers to specify their resource requirements and design their application without worrying about physical infrastructure
- Allows Deployment Administrators specify policies for quantity and location of resources inside various clouds.
- Automates the entire process of creating new workflows and installing them, managing them during runtime, uninstalling them as necessary
- Workflow creation includes virtual networks, computers, storage inside the clouds as well as the network between the clouds
- □ All interfaces currently are XML based. Plan to implement GUI based consoles.

Hierarchy of Controllers

Controllers exchange and implement policies

Washington University in St. Louis

http://www.cse.wustl.edu/~jain/talks/adn att.htm_

Resource Control

- Tenants keep complete control of their data.
 NSP does not have to look at the application data to enforce application level policies
- NSPs keep complete control of their equipment.
 tenants communicate their policies to NSP's control plane
- VFs and Middle boxes can be located anywhere on the global Internet (Of course, performance is best when they are close by)
- Tenants or NSPs can own OpenADN modules. NSPs can offer "Service Chaining" service

Challenges in Service Chaining

Dynamic:

> Forwarding changes with state of the servers, links, ...

Content sensitive:

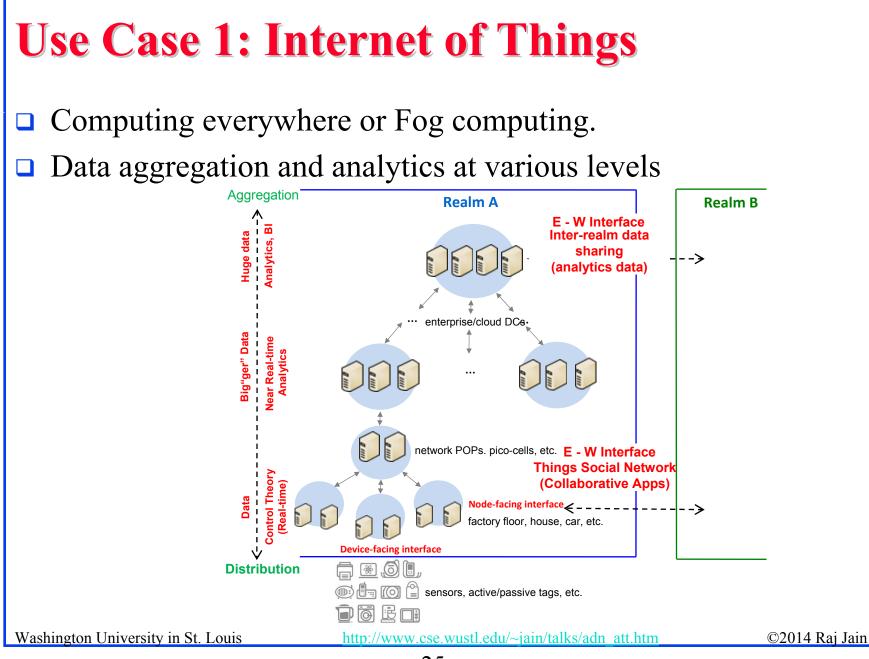

> Different for different types of videos, read-writes, ...

Distributed Control:

- > Equipment belongs to infrastructure provider
- > Data belongs to Tenants

□ Massive Scale:

- > Billions of Users with different user context
- □ Stateful Services:
 - All packets of a flow should be sent to the same replica
 Message level services (firewalls),
 - Description Packet level services (intrusion detection)

Use Case 2: Smart WANs

Service Chaining

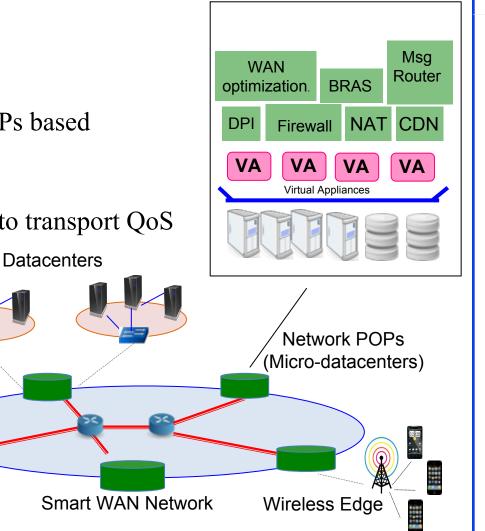

Washington University in St. Louis

- Message-level Middleboxes
- Packet-level Middleboxes
- Dynamically place services at POPs based on application topology

Access

Networks

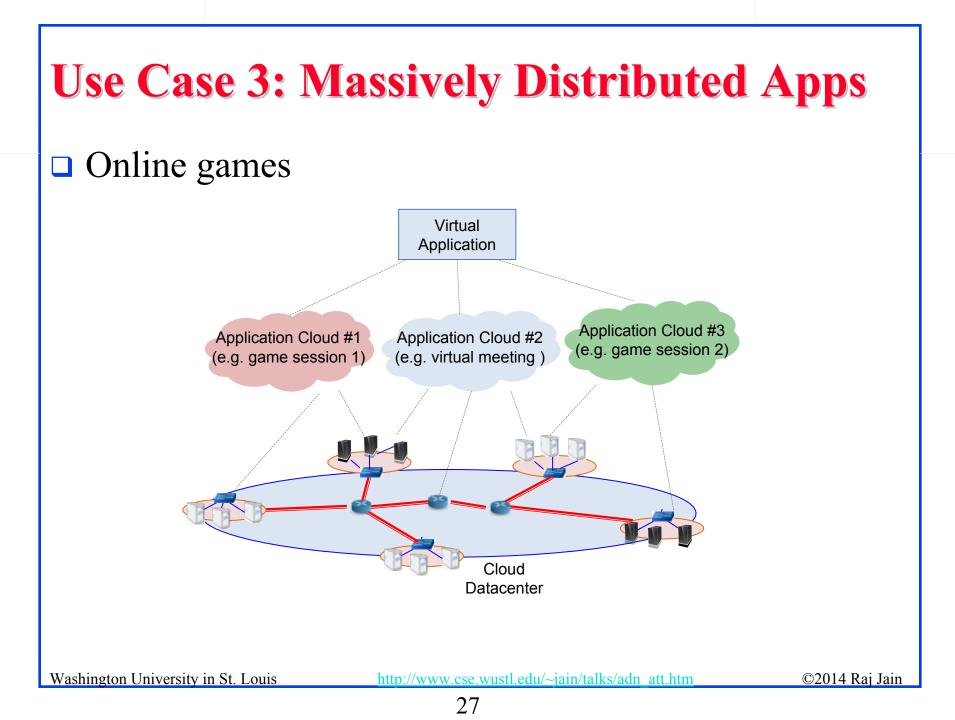

- Provide differentiated transport
- Contextual mapping of messages to transport QoS

26

http://www.cse.wustl.edu/~jain/talks/adn att.htm

Summary

- 1. **Technology Thrashing**: Technology changing faster than deployment.
- 2. Virtual Networking Functions (VNFs) will be replicated and deployed globally

 \Rightarrow Need dynamic service chaining based on user, network, and application context

- 3. Virtual functions useful not only for networking but also for all other global enterprises and games → New business opportunity for EV Infrastructure service
 - \Rightarrow New business opportunity for FV Infrastructure service
- 4. **AppFabric** allows customers to select **multiple clouds** from different providers and **share wide area network** infrastructure and specify their policies
- 5. NSPs keep complete **control** over their resources. Tenants keep complete control over their traffic.
- 6. Can be implemented incrementally **now**.
