[ain/](http://www.cse.wustl.edu/~jain/)

- ❑ Spread Spectrum
- ❑ Wireless local area networks
- ❑ Wireless LAN standard: IEEE 802.11
- ❑ Hiperlan
- ❑ Wireless ATM

Mobile vs Wireless

- ❑ Mobile vs Stationary
- ❑ Wireless vs Wired
- ❑ Wireless \Rightarrow media sharing issues
- ❑ Mobile \Rightarrow routing, addressing issues

Frequency Hopping Spread Spectrum

- ❑ Pseudo-random frequency hopping
- ❑ Spreads the power over a wide spectrum
⇒ Spread Spectrum
- ❑ Developed initially for military
- ❑ Patented by actress Hedy Lamarr (1942)
- ❑ Narrowband interference can't jam

Spectrum

(a) Normal

(b) Frequency Hopping

Direct-Sequence Spread Spectrum

- ❑ Spreading factor = Code bits/data bit, 10-100 commercial (Min 10 by FCC), 10,000 for military
- ❑ Signal bandwidth $>10 \times$ data bandwidth
- ❑ Code sequence synchronization
- ❑ Correlation between codes \Rightarrow Interference \Rightarrow Orthogonal

DS Spectrum

Time Domain

Frequency Domain

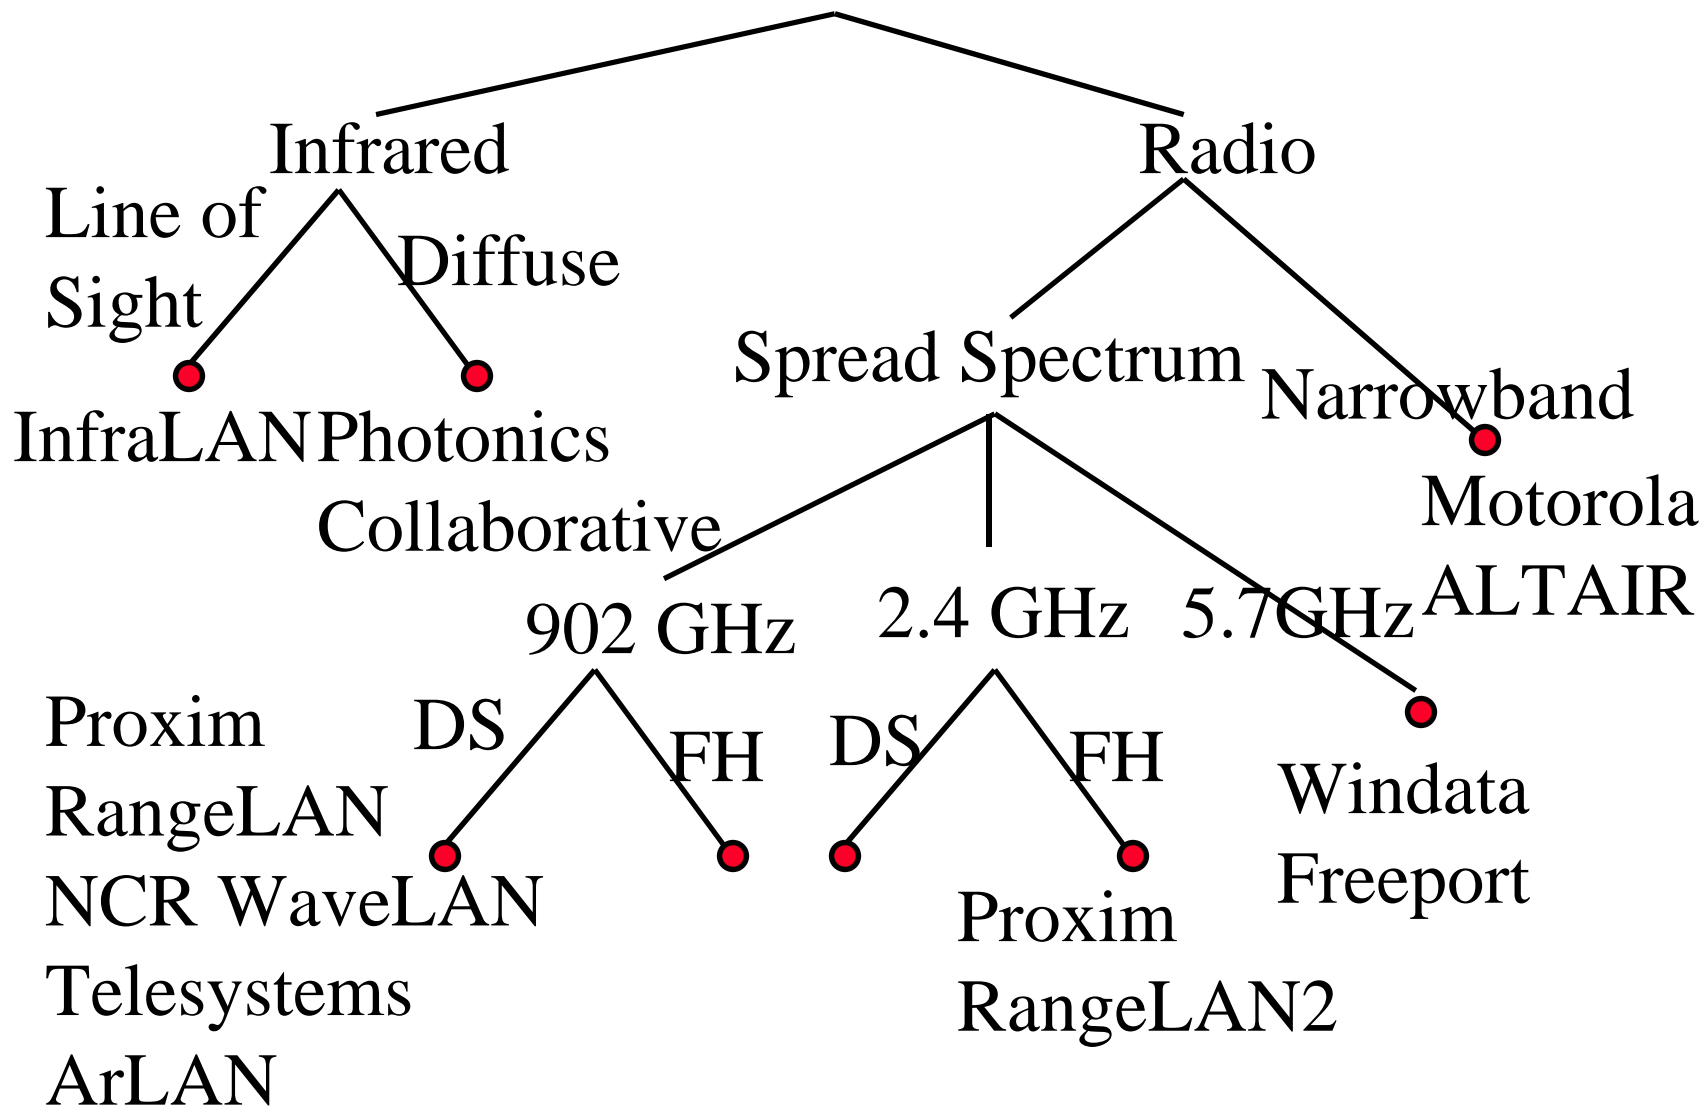

Wireless LANs

- ❑ IR \Rightarrow Line of sight, short range, indoors
- ❑ RF \Rightarrow Need license
- ❑ Spread-Spectrum: Resistance to interference

Wireless LANs

Wireless LAN Products

- ❑ Alps - Radioport
- ❑ AT&T - WaveLAN
- ❑ A.T. Schindler - FIRLAN
- ❑ Carrier Communications - Carriernet
- ❑ California Microwave - Radio Link
- ❑ Digital (Compaq) - RoamAbout
- ❑ IBM - Infrared wireless LAN Adapter
- ❑ Digital Ocean - Grouper
- ❑ InfraLAN Technologies - InfraLAN
- ❑ Motorola - ALTAIR Plus II
- ❑ O'Neill Communications - LAWN

WLAN Products (Cont.)

- ❑ Photonics - Collaborate Series
- ❑ Proxim- RangeLAN2
- ❑ Solectek - AirLAN
- ❑ Spectrix - SpectrixLite
- ❑ TELXON - ARLAN 600
- ❑ Travelling Software - Airshare
- ❑ WiLAN - 902-20
- ❑ Windata - FreePort
- ❑ Xerox - PARCTAB
- ❑ Xircom - NetWave

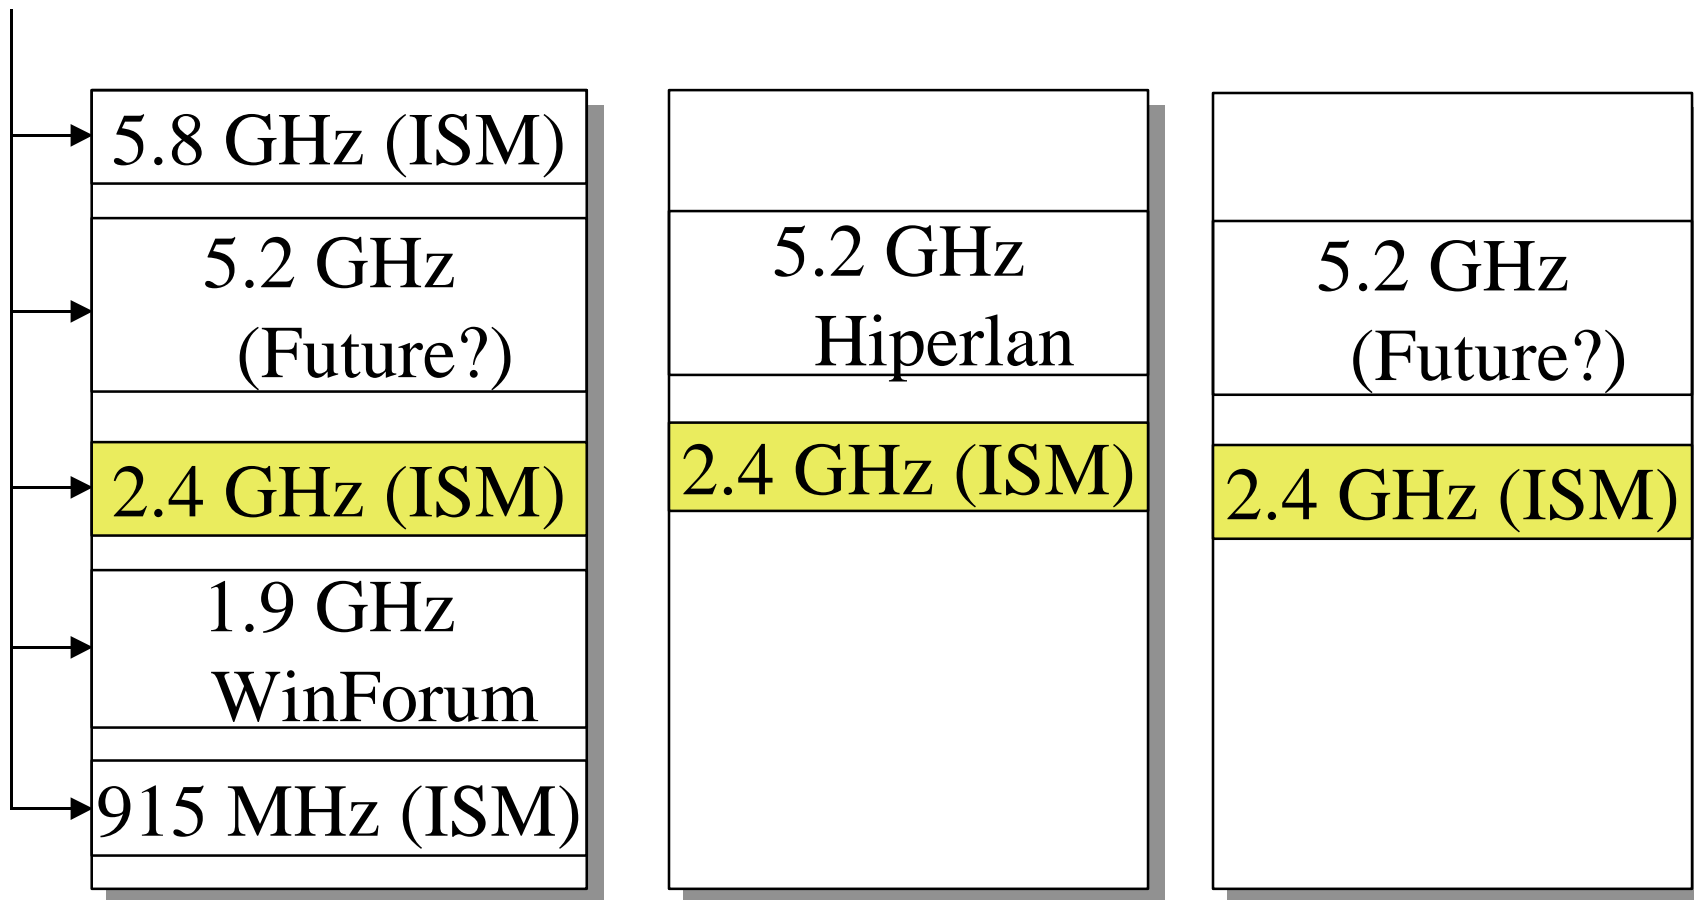

IEEE 802.11 Features

- ❑ 1 and 2 Mbps
- ❑ Supports both Ad-hoc and base-stations
- ❑ Supports multiple priorities
- ❑ Supports time-critical and data traffic
- ❑ Power management allows a node to doze off
- ❑ Spread Spectrum \Rightarrow No licensing required.

Three Phys: Direct Sequence, Frequency Hopping, 915-MHz, **2.4 GHz** (Worldwide ISM), 5.2 GHz, and Diffused Infrared (850-900 nm) bands.

Why 2.4 GHz?

IEEE 802.11

Hidden Node Problem

- ❑ C cannot hear A.
It may start transmitting while A is also transmitting
⇒ A and C can't detect collision.
- ❑ Only the receiver can help avoid collisions

4-Way Handshake

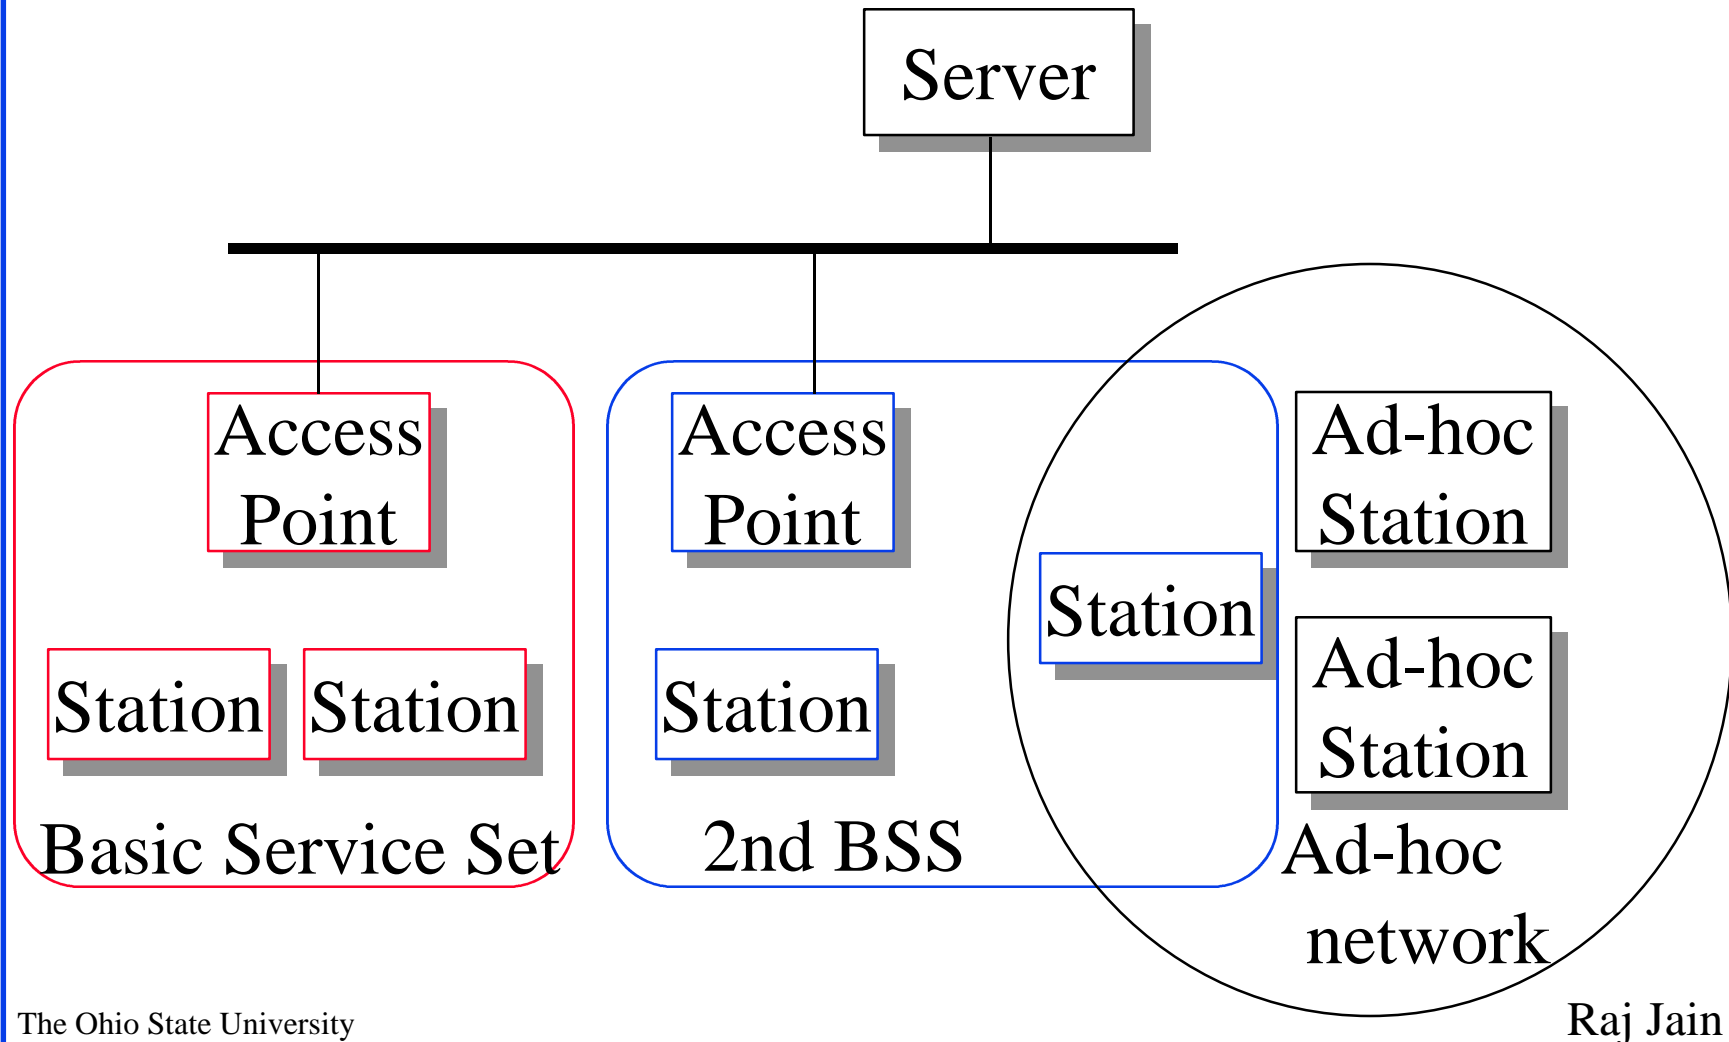

IEEE 802.11 MAC

- ❑ Carrier Sense Multiple Access with Collision Avoidance (CSMA/CA)
- ❑ Listen before you talk. If the medium is busy, the transmitter backs off for a random period.
- ❑ Avoids collision by sending a short message: Ready to send (RTS)
RTS contains dest. address and duration of message.
Tells everyone to backoff for the duration.
- ❑ Destination sends: Clear to send (CTS)
- ❑ Can not detect collision \Rightarrow Each packet is acked.
- ❑ MAC level retransmission if not acked.

Peer-to-Peer or Base Stations?

- ❑ Ad-hoc (Autonomous) Group:
 - Two stations can communicate
 - All stations have the same logic
 - No infrastructure, Suitable for small area
- ❑ Infrastructure Based: Access points (base units)
 - Stations can be simpler than bases.
 - Base provide connection for off-network traffic
 - Base provides location tracking, directory, authentication \Rightarrow Scalable to large networks
- ❑ IEEE 802.11 provides both.

IEEE 802.11 Architecture

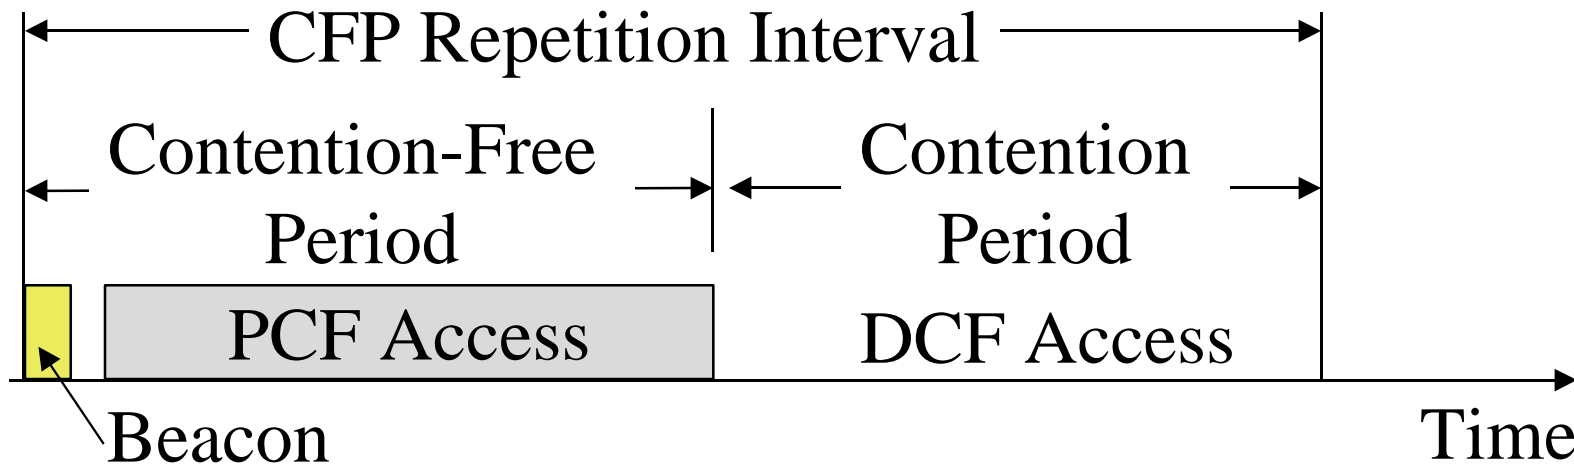

IEEE 802.11 Priorities

- ❑ Initial interframe space (IFS)
- ❑ Highest priority frames, e.g., Acks, use short IFS (SIFS)
- ❑ Medium priority time-critical frames use “Point Coordination Function IFS” (PIFS)
- ❑ Asynchronous data frames use “Distributed coordination function IFS” (DIFS)

Time Critical Services

- ❑ Timer critical services use Point Coordination Function
- ❑ The point coordinator allows only one station to access
- ❑ Coordinator sends a beacon frame to all stations. Then uses a polling frame to allow a particular station to have contention-free access
- ❑ Contention Free Period (CFP) varies with the load.

Power Management

- ❑ A station can be in one of three states:
 - Transmitter on
 - Receiver only on
 - Dozing: Both transmitter and receivers off.
- ❑ Access point (AP) buffers traffic for dozing stations.
- ❑ AP announces which stations have frames buffered.
Traffic indication map included in each beacon.
All multicasts/broadcasts are buffered.
- ❑ Dozing stations wake up to listen to the beacon.
If there is data waiting for it, the station sends a poll frame to get the data.

IEEE 802.11 Security

- ❑ Authentication:
 - New nodes issue a "request for authentication"
 - Network sends a block of random text.
 - The node encrypts it with network password and returns.
- ❑ Currently, *one* shared secret key (password) per net.
- ❑ The same encryption algorithm is used for privacy. Wired Equivalency Privacy (WEP) Algorithm is based on RC4 PRNT algorithm developed by RSA Data Security, Inc.

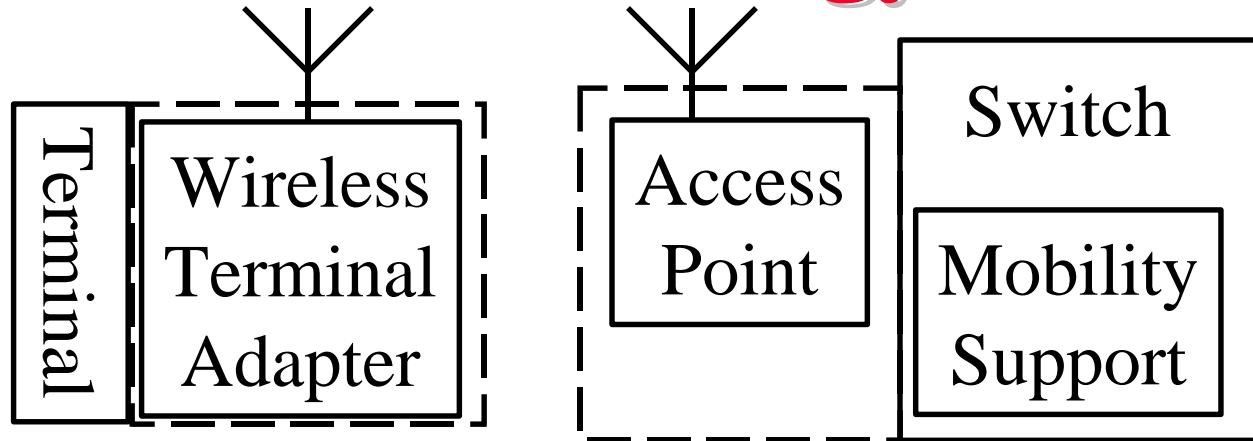

Status and Future

- ❑ 802.11 including both MAC and PHY approved June 1997.
- ❑ More bandwidth in future by:
 1. Better encoding: Multilevel modulation \Rightarrow 8 Mbps
 2. Fewer channels with more bandwidth \Rightarrow 4 MHz channels. Or Entire ISM band for one channel.
 3. Find another band. May get 150 MHz band in 5-GHz band. Fifteen 10-MHz channels with 15-20 Mb/s.

HIPERLAN

- ❑ High Performance Radio LAN
- ❑ European Telecom Standards Institute (ETSI)'s subtechnical committee RES10.
- ❑ 5.12-5.30 GHz and 17.1-17.3 GHz bands
- ❑ Phy: 23.5 Mbps on 23.5 MHz, non-spread spectrum (GMSK)
- ❑ MAC: CSMA/CA but different from IEEE 802.11
- ❑ Peer-to-peer only.
- ❑ Power management: Nodes announce their wakeup cycle. Other nodes send according to the cycle. A low-bit rate header allows nodes to keep most ckts off.

Wireless ATM: Terminology

- ❑ **Wireless Terminal Adapter:** Allows a terminal communicate via wireless
- ❑ **Wireless Access Point:** Allows a switch to communicate via wireless
- ❑ **Mobility Support Adapter:** Allows a switch to maintain VCCs with Mobile terminals and switches

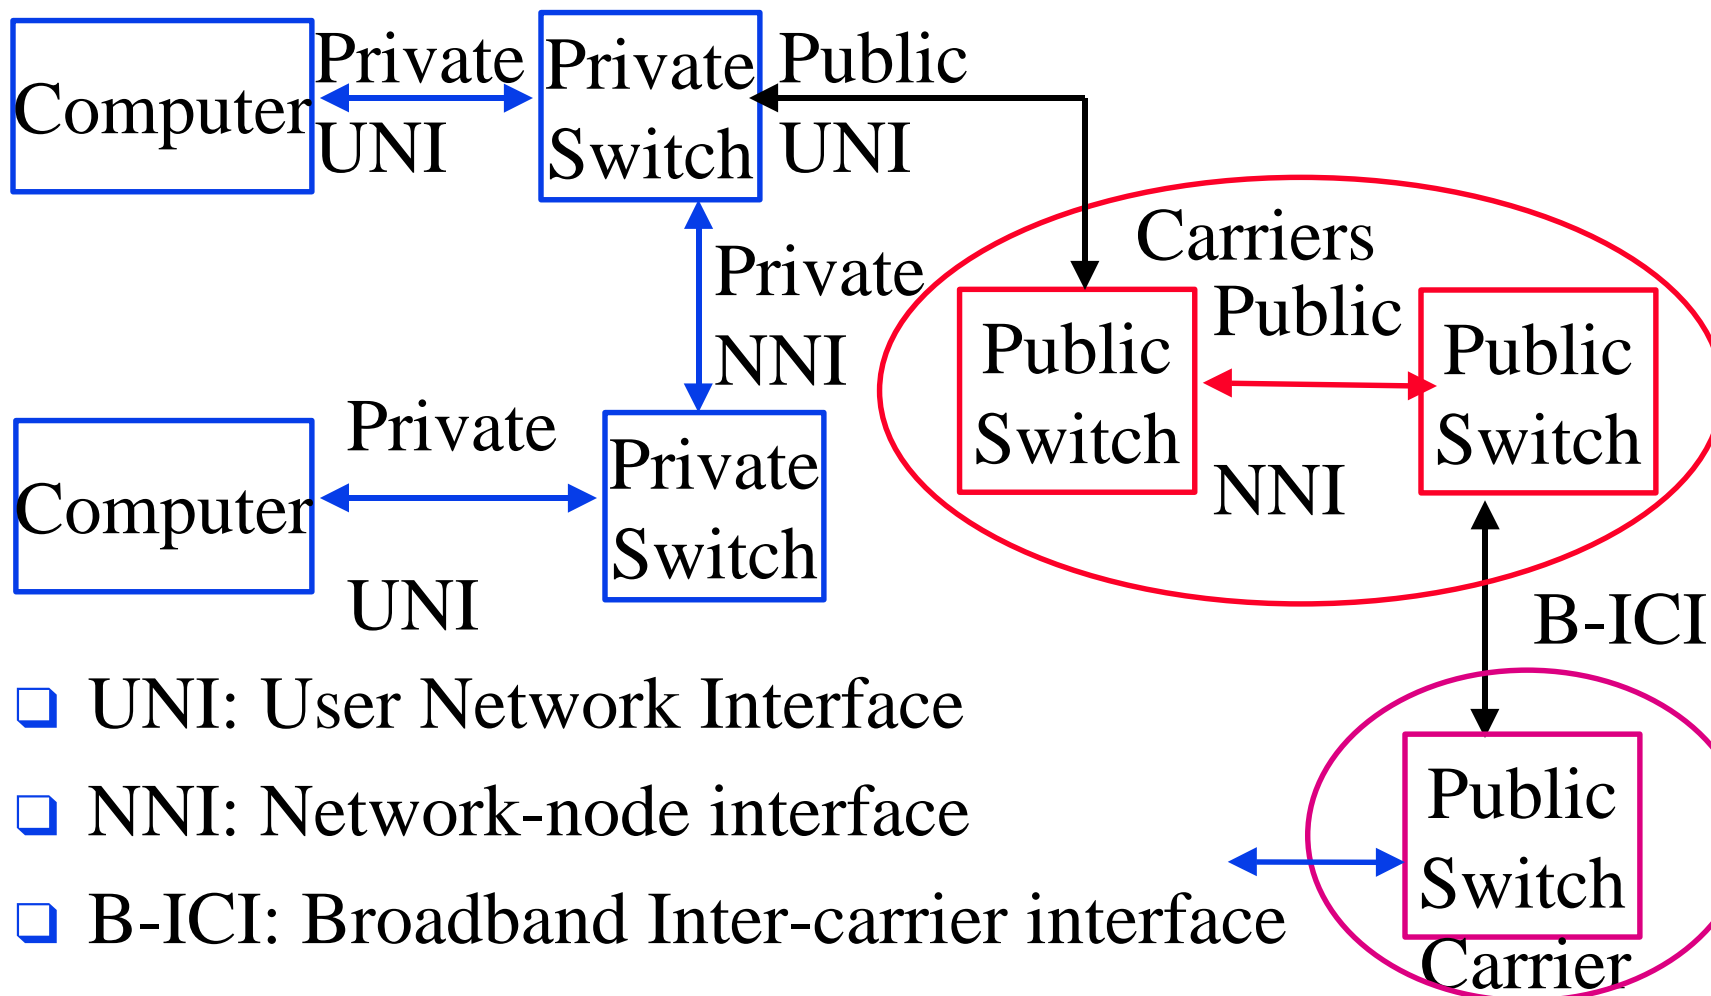

Reference Configurations

1. Fixed Wireless Access
3. Mobile Networks
5. PCS Access

2. Mobile End-Users,
4. Ad Hoc Networks
6. PCS Interworking

ATM Interfaces

WATM Protocol Stacks

- ❑ Wireless Access Layer (WAL) includes PHY, MAC, and LLC layers.
- ❑ M = Mobility enhanced = Handoff, Location, QoS
- ❑ PNNI', UNI', BICI' support transport of mobility info

AAL
ATM
WAL

User Plane

PNNI + M, UNI + M, B-ICI + M
Signaling AAL
ATM
WAL

PNNI', UNI' B-ICI'
Signaling AAL
ATM
WAL

Control Planes

Summary

- ❑ Spread spectrum: Frequency hopping or direct sequence
- ❑ Proprietary LANs: Photonics, RangeLan, ALTAIR
- ❑ LAN Standards: IEEE 802.11, Hiperlan
- ❑ Wireless ATM work is just beginning
