

# Virtual Private Networks

Raj Jain

**Raj Jain is now at  
Washington University in Saint Louis  
Jain@cse.wustl.edu  
<http://www.cse.wustl.edu/~jain/>**

- ❑ Types of VPNs
- ❑ When and why VPN?
- ❑ VPN Design Issues
- ❑ Security Issues
- ❑ VPN Examples: PPTP, L2TP, IPSec
- ❑ Authentication Servers: RADIUS and DIAMETER
- ❑ VPNs using Multiprotocol Label Switching

# What is a VPN?

- Private Network: Uses leased lines

- *Virtual* Private Network: Uses public Internet

# Types of VPNs

- ❑ WAN VPN: Branch offices
- ❑ Access VPN: Roaming Users
- ❑ Extranet VPNs: Suppliers and Customers

# Why VPN?

- ❑ Reduced telecommunication costs
- ❑ Less administration  $\Rightarrow$  60% savings (Forester Res.)
- ❑ Less expense for client and more income for ISPs
- ❑ Long distance calls replaced by local calls
- ❑ Increasing mobility  $\Rightarrow$  More remote access
- ❑ Increasing collaborations  
 $\Rightarrow$  Need networking links with partners

# When to VPN?

- ❑ More Locations, Longer Distances, Less Bandwidth/site, QoS less critical  
⇒ VPN more justifiable
- ❑ Fewer Locations, Shorter Distances, More Bandwidth/site, QoS more critical  
⇒ VPN less justifiable

# VPN Design Issues

1. Security
2. Address Translation
3. Performance: Throughput, Load balancing (round-robin DNS), fragmentation
4. Bandwidth Management: RSVP
5. Availability: Good performance at all times
6. Scalability: Number of locations/Users
7. Interoperability: Among vendors, ISPs, customers (for extranets)  $\Rightarrow$  Standards Compatibility, With firewall

# Design Issues (Cont)

8. Compression: Reduces bandwidth requirements
9. Manageability: SNMP, Browser based, Java based, centralized/distributed
10. Accounting, Auditing, and Alarming
11. Protocol Support: IP, non-IP (IPX)
12. Platform and O/S support: Windows, UNIX, MacOS, HP/Sun/Intel
13. Installation: Changes to desktop or backbone only
14. Legal: Exportability, Foreign Govt Restrictions, Key Management Infrastructure (KMI) initiative  
⇒ Need key recovery

# Security 101

- ❑ Integrity: Received = sent?
- ❑ Availability: Legal users should be able to use.  
Ping continuously  $\Rightarrow$  No useful work gets done.
- ❑ Confidentiality and Privacy:  
No snooping or wiretapping
- ❑ Authentication: You are who you say you are.  
A student at Dartmouth posing as a professor canceled the exam.
- ❑ Authorization = Access Control  
Only authorized users get to the data

# Secret Key Encryption

- ❑  $\text{Encrypted\_Message} = \text{Encrypt}(\text{Key}, \text{Message})$
- ❑  $\text{Message} = \text{Decrypt}(\text{Key}, \text{Encrypted\_Message})$
- ❑ Example: Encrypt = division
- ❑  $433 = 48 \text{ R } 1$  (using divisor of 9)

# Public Key Encryption

- ❑ Invented in 1975 by Diffie and Hellman
- ❑  $\text{Encrypted\_Message} = \text{Encrypt}(\text{Key1}, \text{Message})$
- ❑  $\text{Message} = \text{Decrypt}(\text{Key2}, \text{Encrypted\_Message})$

# Public Key Encryption

- ❑ RSA: Encrypted\_Message =  $m^3 \bmod 187$
- ❑ Message = Encrypted\_Message<sup>107</sup> mod 187
- ❑ Key1 =  $\langle 3, 187 \rangle$ , Key2 =  $\langle 107, 187 \rangle$
- ❑ Message = 5
- ❑ Encrypted Message =  $5^3 = 125$
- ❑ Message =  $125^{107} \bmod 187$   
=  $125^{(64+32+8+2+1)} \bmod 187$   
=  $\{(125^{64} \bmod 187)(125^{32} \bmod 187) \dots$   
 $(125^2 \bmod 187)(125)\} \bmod 187 = 5$
- ❑  $125^4 \bmod 187 = (125^2 \bmod 187)^2 \bmod 187$

# Public Key (Cont)

- ❑ One key is private and the other is public
- ❑ Message = Decrypt(Public\_Key, Encrypt(Private\_Key, Message))
- ❑ Message = Decrypt(Private\_Key, Encrypt(Public\_Key, Message))

# Digital Signature

- ❑ Message Digest = Hash(Message)
- ❑ Signature = Encrypt(Private\_Key, Hash)
- ❑ Hash(Message) = Decrypt(Public\_Key, Signature)  
⇒ Authentic

# Certificate

- ❑ Like driver license or passport
- ❑ Digitally signed by Certificate authority (CA) - a trusted organization
- ❑ Public keys are distributed with certificates
- ❑ CA uses its public key to sign the certificate  
⇒ Hierarchy of trusted authorities

# Confidentiality

- ❑ User 1 to User 2:
- ❑  $\text{Encrypted\_Message} = \text{Encrypt}(\text{Public\_Key2}, \text{Encrypt}(\text{Private\_Key1}, \text{Message}))$
- ❑  $\text{Message} = \text{Decrypt}(\text{Public\_Key1}, \text{Decrypt}(\text{Private\_Key2}, \text{Encrypted\_Message}))$   
 $\Rightarrow$  Authentic and Private

# Firewall: Bastion Host

- ❑ Bastions overlook critical areas of defense, usually having stronger walls
- ❑ Inside users log on the Bastion Host and use outside services.
- ❑ Later they pull the results inside.
- ❑ One point of entry. Easier to manage security.

# Proxy Servers

- ❑ Specialized server programs on bastion host
- ❑ Take user's request and forward them to real servers
- ❑ Take server's responses and forward them to users
- ❑ Enforce site security policy  
⇒ May refuse certain requests.
- ❑ Also known as application-level gateways
- ❑ With special "Proxy client" programs, proxy servers are almost transparent

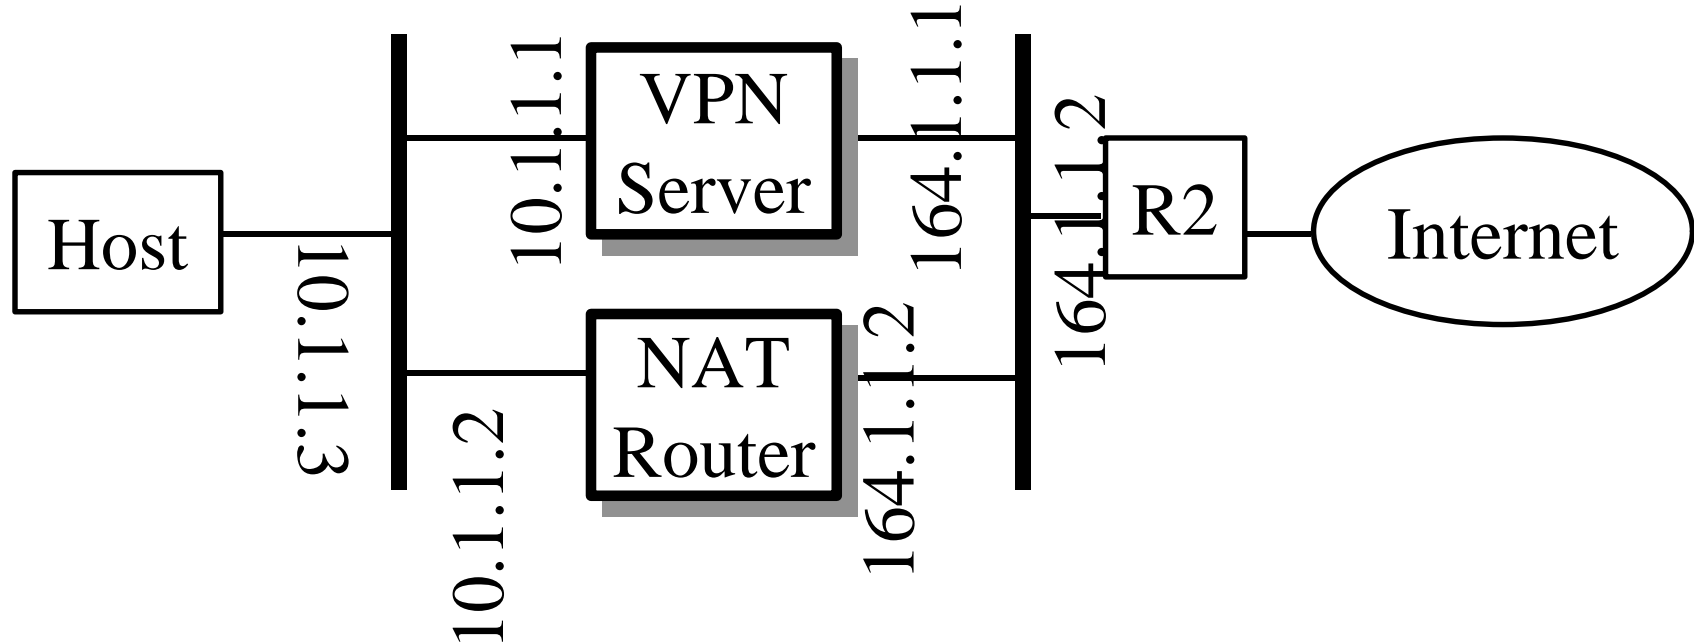

# VPN Security Issues

- ❑ Authentication methods supported
- ❑ Encryption methods supported
- ❑ Key Management
- ❑ Data stream filtering for viruses, JAVA, active X
- ❑ Supported certificate authorities  
(X.509, Entrust, VeriSign)
- ❑ Encryption Layer: Datalink, network, session, application. Higher Layer  $\Rightarrow$  More granular
- ❑ Granularity of Security: Departmental level, Application level, Role-based

# Private Addresses

- ❑ 32-bit Address  $\Rightarrow$  4 Billion addresses max
- ❑ Subnetting  $\Rightarrow$  Limit is much lower
- ❑ Shortage of IP address  $\Rightarrow$  Private addresses
- ❑ Frequent ISP changes  $\Rightarrow$  Private address
- ❑ Private  $\Rightarrow$  Not usable on public Internet
- ❑ RFC 1918 lists such addresses for private use
- ❑ Prefix = 10/8, 172.16/12, 192.168/16
- ❑ Example: 10.207.37.234

# Address Translation

- ❑ NAT = Network Address Translation  
Like Dynamic Host Configuration Protocol (DHCP)
- ❑ IP Gateway: Like Firewall
- ❑ Tunneling: Encapsulation

# Tunnel

IP Land    IP Not Spoken Here    IP Land

- ❑ Tunnel = Encapsulation
- ❑ Used whenever some feature is not supported in some part of the network, e.g., multicasting, mobile IP

# VPN Tunneling Protocols

- ❑ GRE: Generic Routing Encapsulation (RFC 1701/2)
- ❑ PPTP: Point-to-point Tunneling Protocol
- ❑ L2F: Layer 2 forwarding
- ❑ L2TP: Layer 2 Tunneling protocol
- ❑ ATMP: Ascend Tunnel Management Protocol
- ❑ DSLW: Data Link Switching (SNA over IP)
- ❑ IPSec: Secure IP
- ❑ Mobile IP: For Mobile users

# GRE

- ❑ Generic Routing Encapsulation (RFC 1701/1702)
- ❑ Generic  $\Rightarrow$  X over Y for any X or Y
- ❑ Optional Checksum, Loose/strict Source Routing, Key
- ❑ Key is used to authenticate the source
- ❑ Over IPv4, GRE packets use a protocol type of 47
- ❑ Allows router visibility into application-level header
- ❑ Restricted to a single provider network  $\Rightarrow$  end-to-end

# PPTP

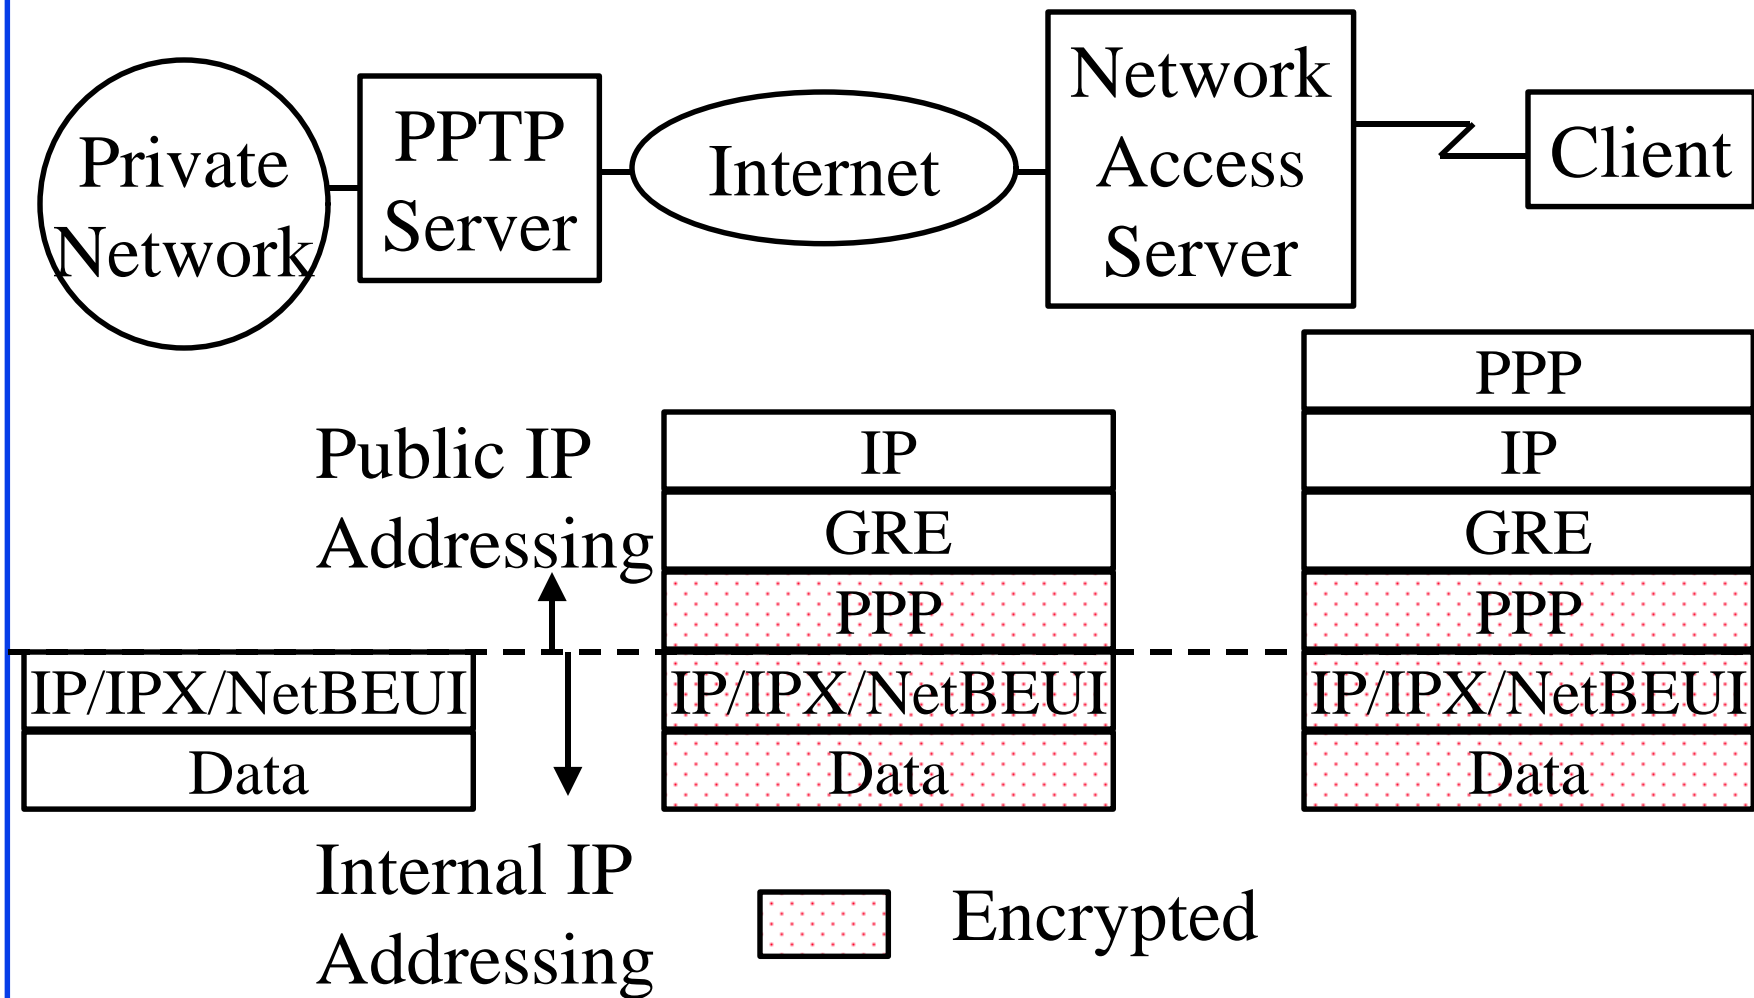

- ❑ PPTP = Point-to-point Tunneling Protocol
- ❑ Developed jointly by Microsoft, Ascend, USR, 3Com and ECI Telematics
- ❑ PPTP server for NT4 and clients for NT/95/98
- ❑ MAC, WFW, Win 3.1 clients from Network Telesystems (nts.com)

# PPTP with ISP Support

- ❑ PPTP can be implemented at Client or at NAS
- ❑ With ISP Support: Also known as Compulsory Tunnel
- ❑ W/O ISP Support: Voluntary Tunnels

# PPTP Packets

# L2TP

- ❑ Layer 2 Tunneling Protocol
- ❑ L2F = Layer 2 Forwarding (From CISCO)
- ❑ L2TP = L2F + PPTP  
Combines the best features of L2F and PPTP
- ❑ Will be implemented in NT5
- ❑ Easy upgrade from L2F or PPTP
- ❑ Allows PPP frames to be sent over non-IP (Frame relay, ATM) networks also (PPTP works on IP only)
- ❑ Allows multiple (different QoS) tunnels between the same end-points. Better header compression.  
Supports flow control

# IPSec

- ❑ Secure IP: A series of proposals from IETF
- ❑ Separate Authentication and privacy
- ❑ Authentication Header (AH) ensures data integrity and authenticity
- ❑ Encapsulating Security Protocol (ESP) ensures privacy and integrity

# IPSec (Cont)

- ❑ Two Modes: Tunnel mode, Transport mode
- ❑ Tunnel Mode  $\Rightarrow$  Encryption at IP level
- ❑ Supports a variety of encryption algorithms
- ❑ Better suited for WAN VPNs (vs Access VPNs)
- ❑ Little interest from Microsoft (vs L2TP)
- ❑ Most IPSec implementations support machine (vs user) certificates  $\Rightarrow$  Any user can use the tunnel
- ❑ Needs more time for standardization than L2TP

# SOCKS

- ❑ Developed by David Koblas in 1990. Backed by NEC
- ❑ Made public and adopted by IETF Authenticated Firewall Traversal (AFT) working group
- ❑ Current version v5 in RFC 1928
- ❑ Session layer proxy
- ❑ Can be configured to proxy any number of TCP or UDP ports
- ❑ Provides authentication, integrity, privacy
- ❑ Can provide address translation
- ❑ Proxy  $\Rightarrow$  Slower performance
- ❑ Desktop-to-Server  $\Rightarrow$  Not suitable for extranets

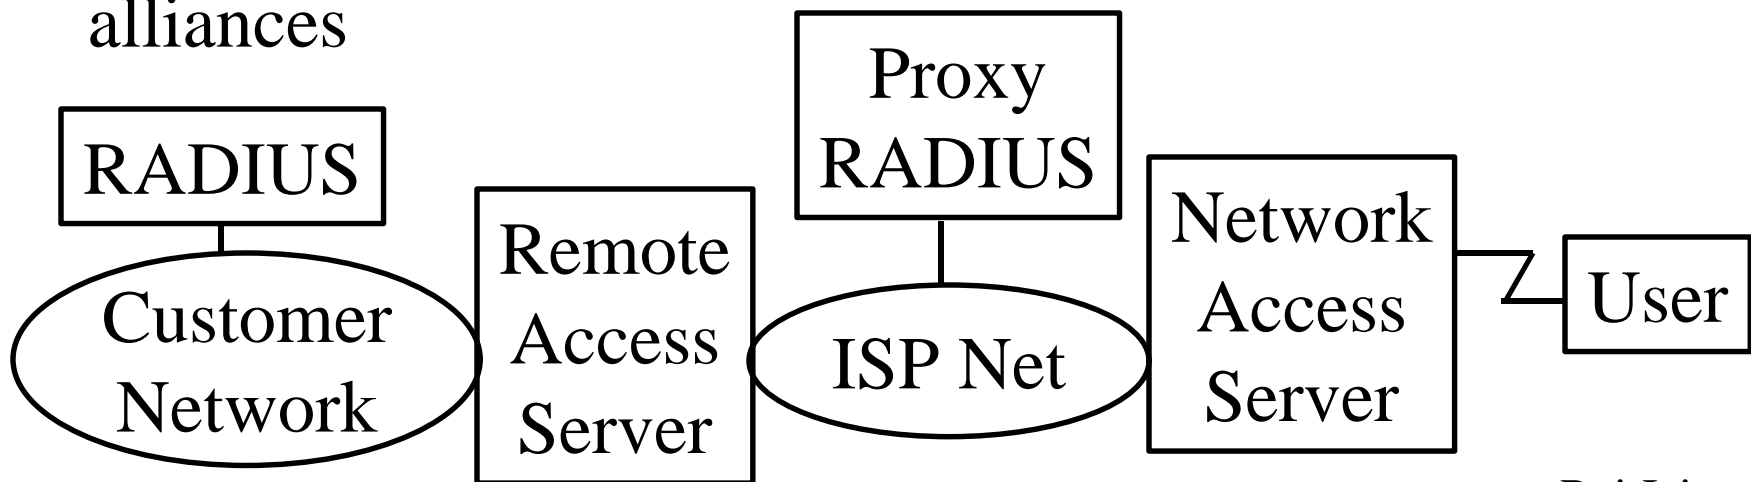

# Application Level Security

- ❑ Secure HTTP
- ❑ Secure MIME
- ❑ Secure Electronic Transaction (SET)
- ❑ Private Communications Technology (PCT)

# RADIUS

- ❑ Remote Authentication Dial-In User Service
- ❑ Central point for Authorization, Accounting, and Auditing data  $\Rightarrow$  AAA server
- ❑ Network Access servers get authentication info from RADIUS servers
- ❑ Allows RADIUS Proxy Servers  $\Rightarrow$  ISP roaming alliances

# DIAMETER

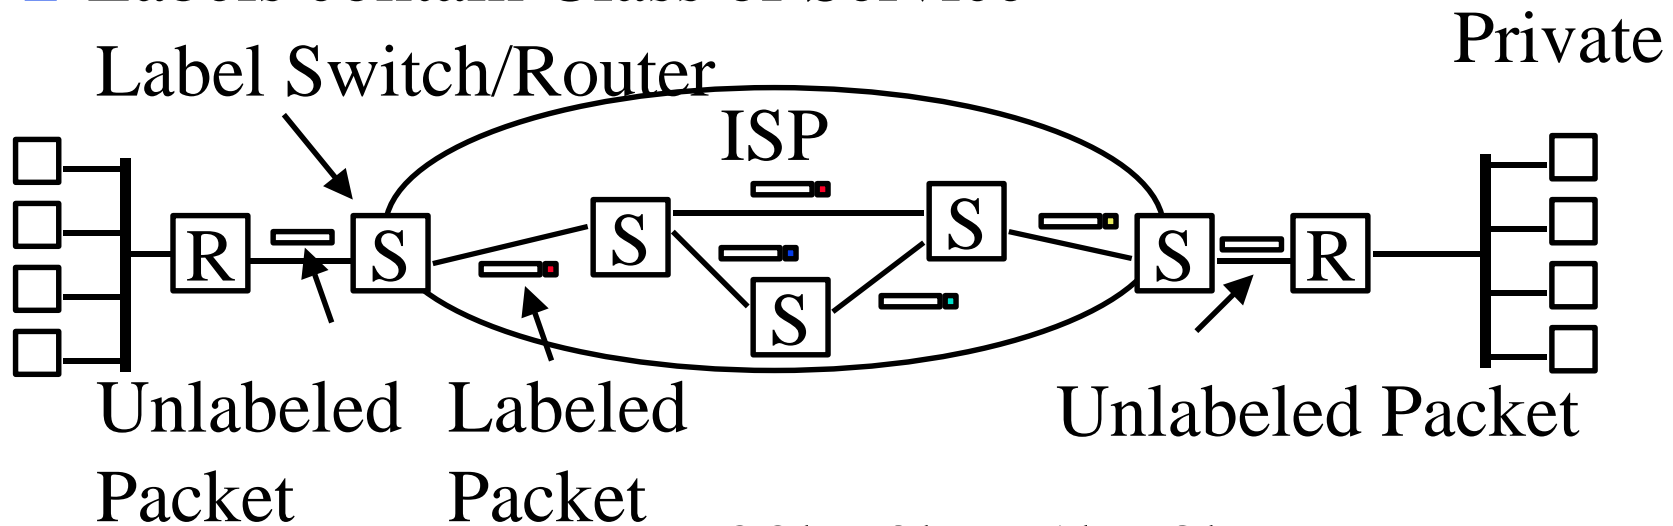

- ❑ Enhanced RADIUS
- ❑ Light weight
- ❑ Can use both UDP and TCP
- ❑ Servers can send unsolicited messages to Clients  
⇒ Increases the set of applications
- ❑ Support for vendor specific Attribute-Value-Pairs (AVPs) and commands
- ❑ Authentication and privacy for policy messages

# Quality of Service (QoS)

- ❑ Resource Reservation Protocol (RSVP) allows clients to reserve bandwidth
- ❑ Need routers with proper scheduling: IP Precedence, priority queueing, Weighted Fair Queueing (WFQ)
- ❑ All routers may not support RSVP
- ❑ Even more difficult if multiple ISPs

# VPN Support with MPLS

- ❑ Multiprotocol Label Switching
- ❑ Allows packets to be switched using labels (tags)
  - ⇒ Creates connections across a network
- ❑ Labels contain Class of Service

# Summary

- ❑ VPN allows secure communication on the Internet
- ❑ Three types: WAN, Access, Extranet
- ❑ Key issues: address translation, security, performance
- ❑ Layer 2 (PPTP, L2TP), Layer 3 (IPSec), Layer 5 (SOCKS), Layer 7 (Application level) VPNs
- ❑ RADIUS allows centralized authentication server
- ❑ QoS is still an issue  $\Rightarrow$  MPLS
